Lecture in a Nutshell

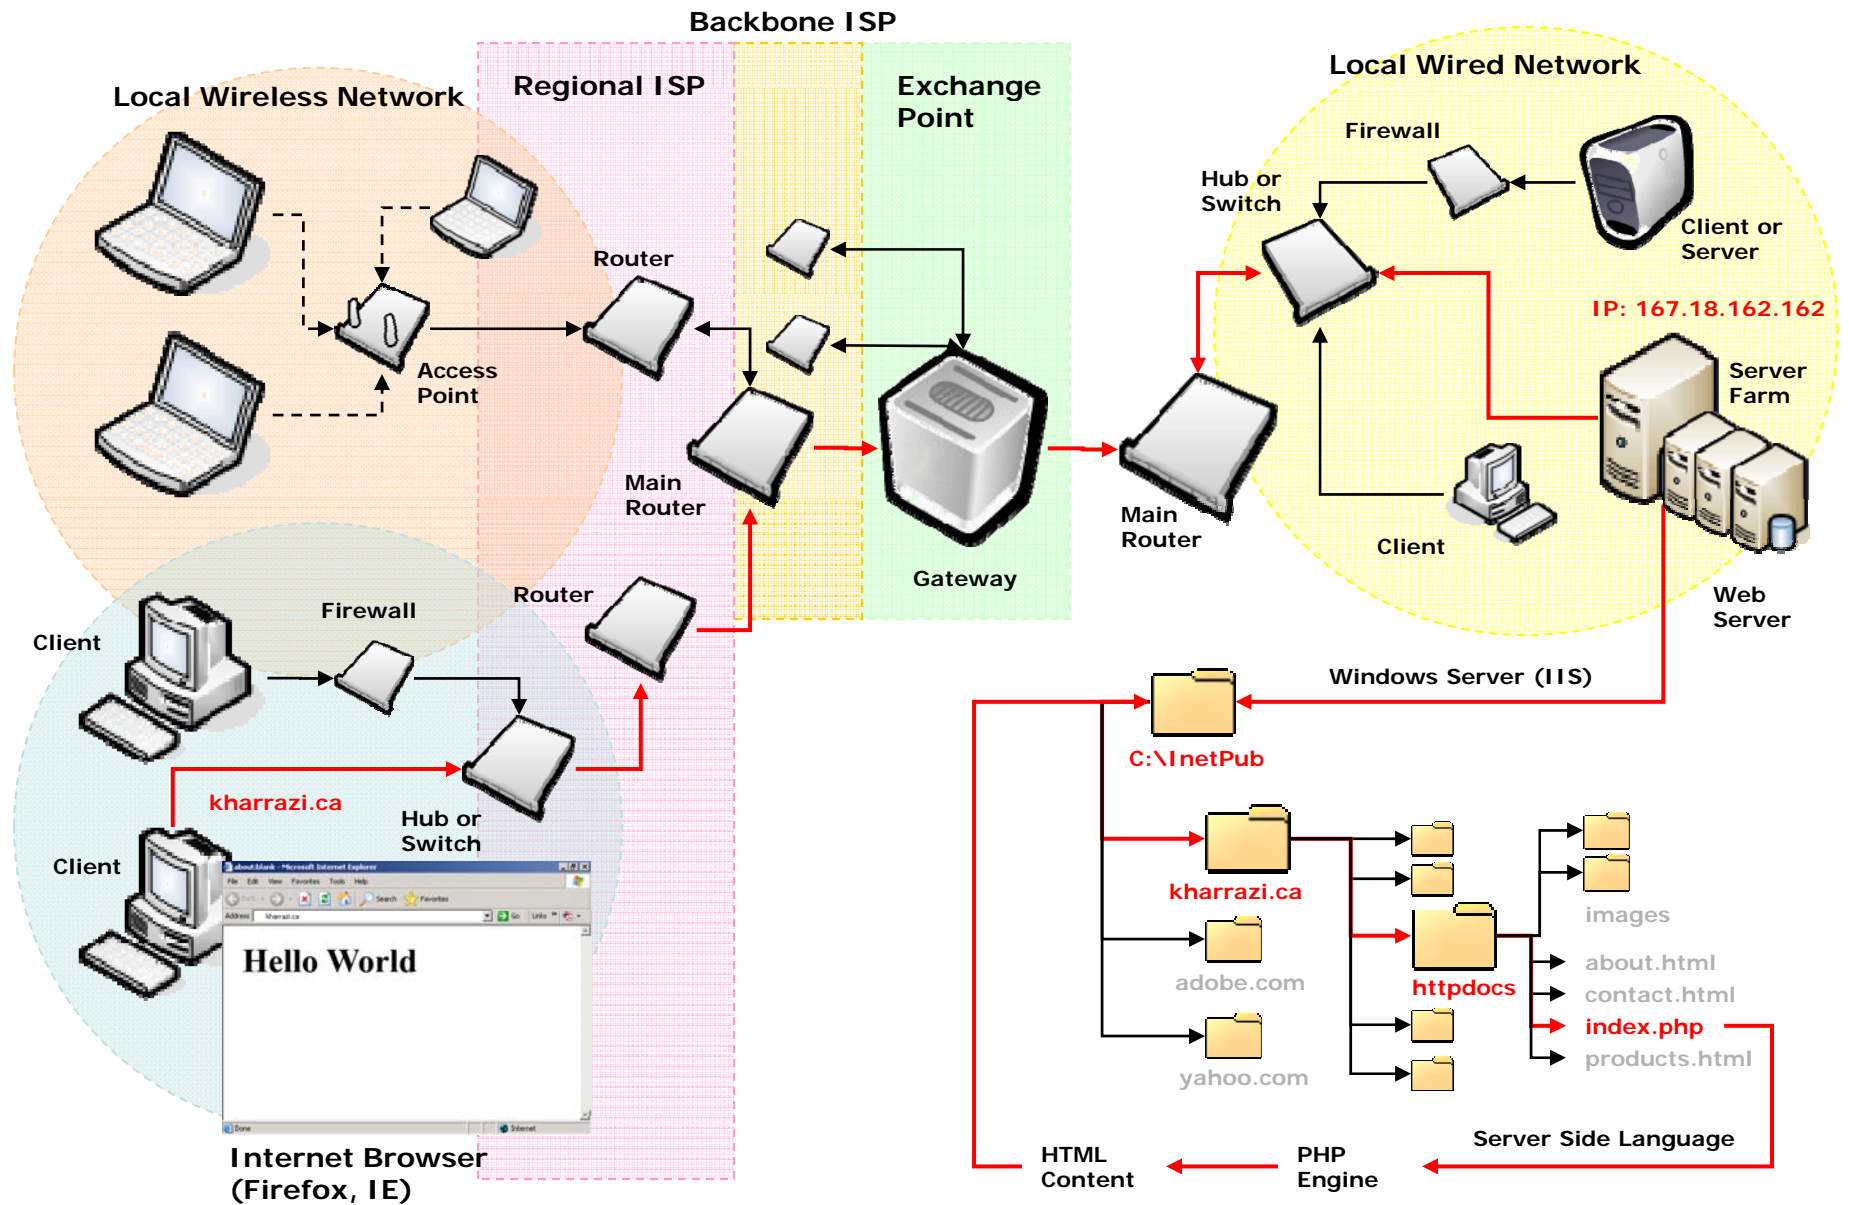

1. PHP Intro
2. PHP Syntax
3. PHP *echo*
4. PHP Commenting
5. PHP Variables

1. PHP Introduction

- A PHP file may contain text, HTML tags and scripts. Scripts in a PHP file are executed on the server.
- **What is PHP?**
 - PHP stands for **PHP: Hypertext Preprocessor**
 - PHP is a *server-side scripting language*, like Perl or ASP
 - PHP scripts are *executed on the server*
 - PHP supports many databases (**MySQL**, Informix, Oracle, Sybase, Solid, PostgreSQL, Generic ODBC, etc.)
 - PHP is an open source software (OSS)
 - PHP is *free* to download and use

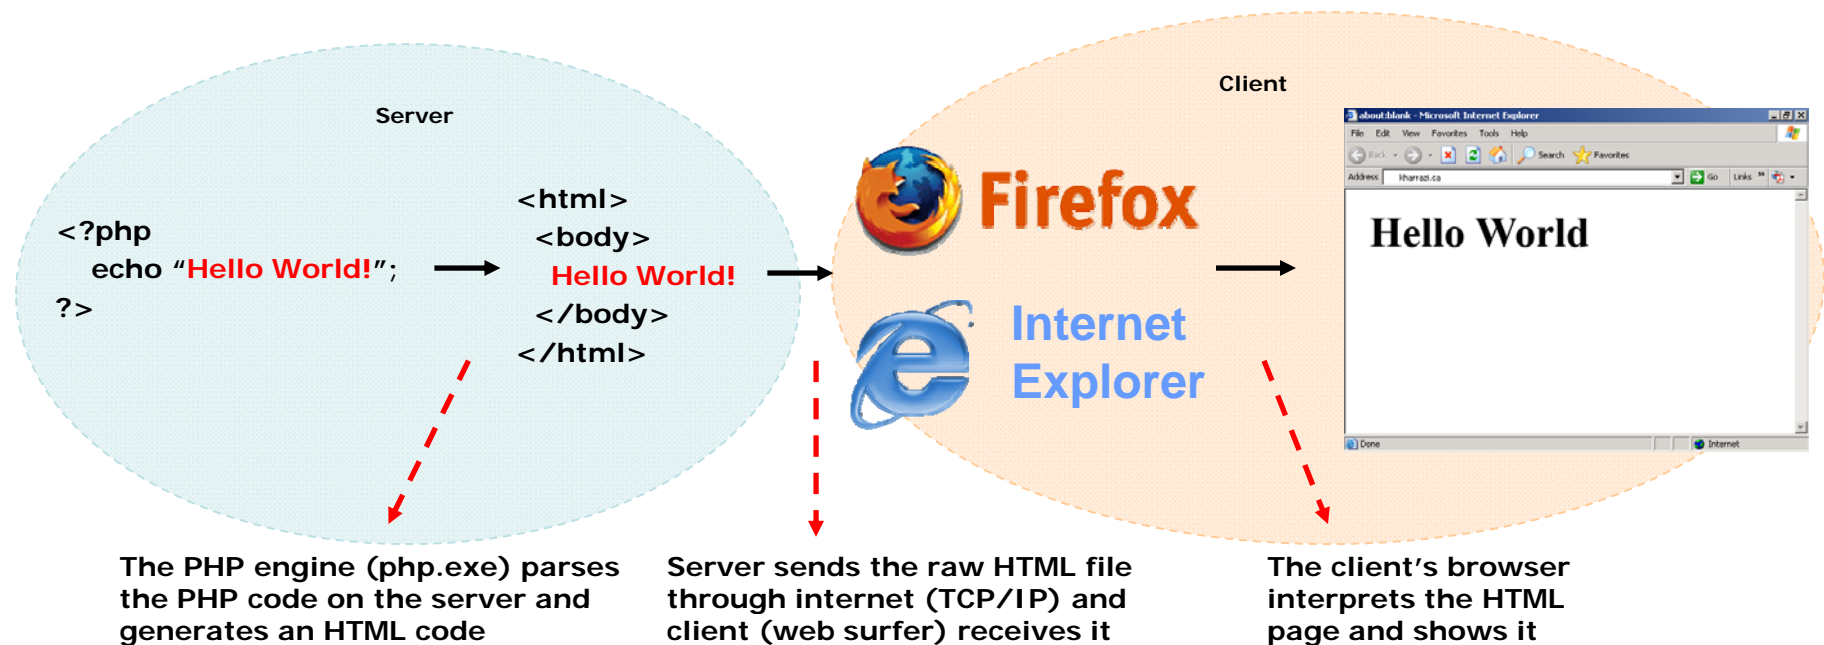

PHP Introduction (cont.)

- **What is a PHP File?**
 - PHP files may contain text, HTML tags and scripts
 - PHP files are *returned to the browser as plain HTML*
 - PHP files have a file extension of ".php", ".php3", or ".phtml"
- **Why PHP?**
 - PHP runs on different platforms (Windows, Linux, Unix, etc.)
 - PHP is compatible with almost all servers used today (Apache, IIS, etc.)
 - PHP is *free* to download
 - PHP is easy to learn and runs efficiently on the server side

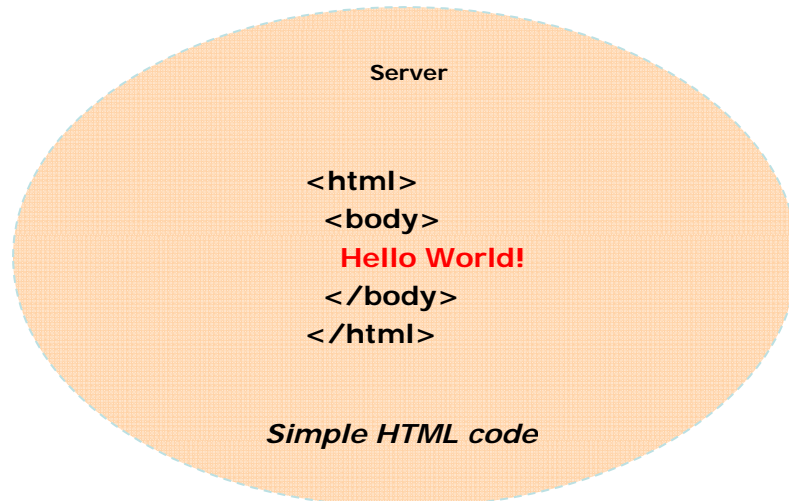

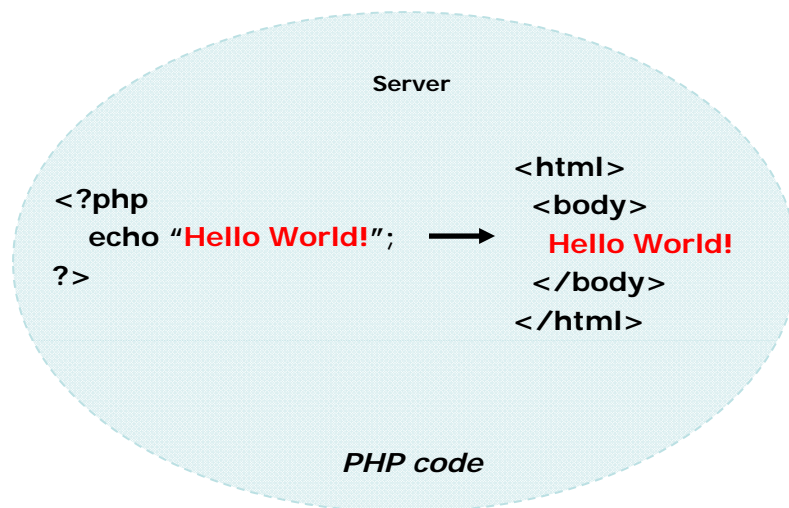

PHP Introduction (cont.)

- You cannot view the PHP source code by selecting "View source" in the browser - you will only see the output from the PHP file, which is plain HTML. This is because the scripts are executed on the server before the result is sent back to the browser.

PHP Introduction (cont.)

The screenshot shows a web browser window with the address bar displaying `http://flame.cs.dal.ca/~kharrazi/teaching/hinf_6220/slides/html/01...`. The browser's menu is open, showing options like "Go To", "Stop", "Refresh", "Text Size", "Encoding", "Source", "Privacy Report...", and "Full Screen". The browser displays the text "Hello World".

Below the browser window is a Notepad window titled "01_hello_world[1] - Notepad". The Notepad window contains the following HTML code:

```
<html>
  <head></head>
  <body>
    Hello world!
  </body>
</html>
```

Below the Notepad window, there is a text box with the following text:

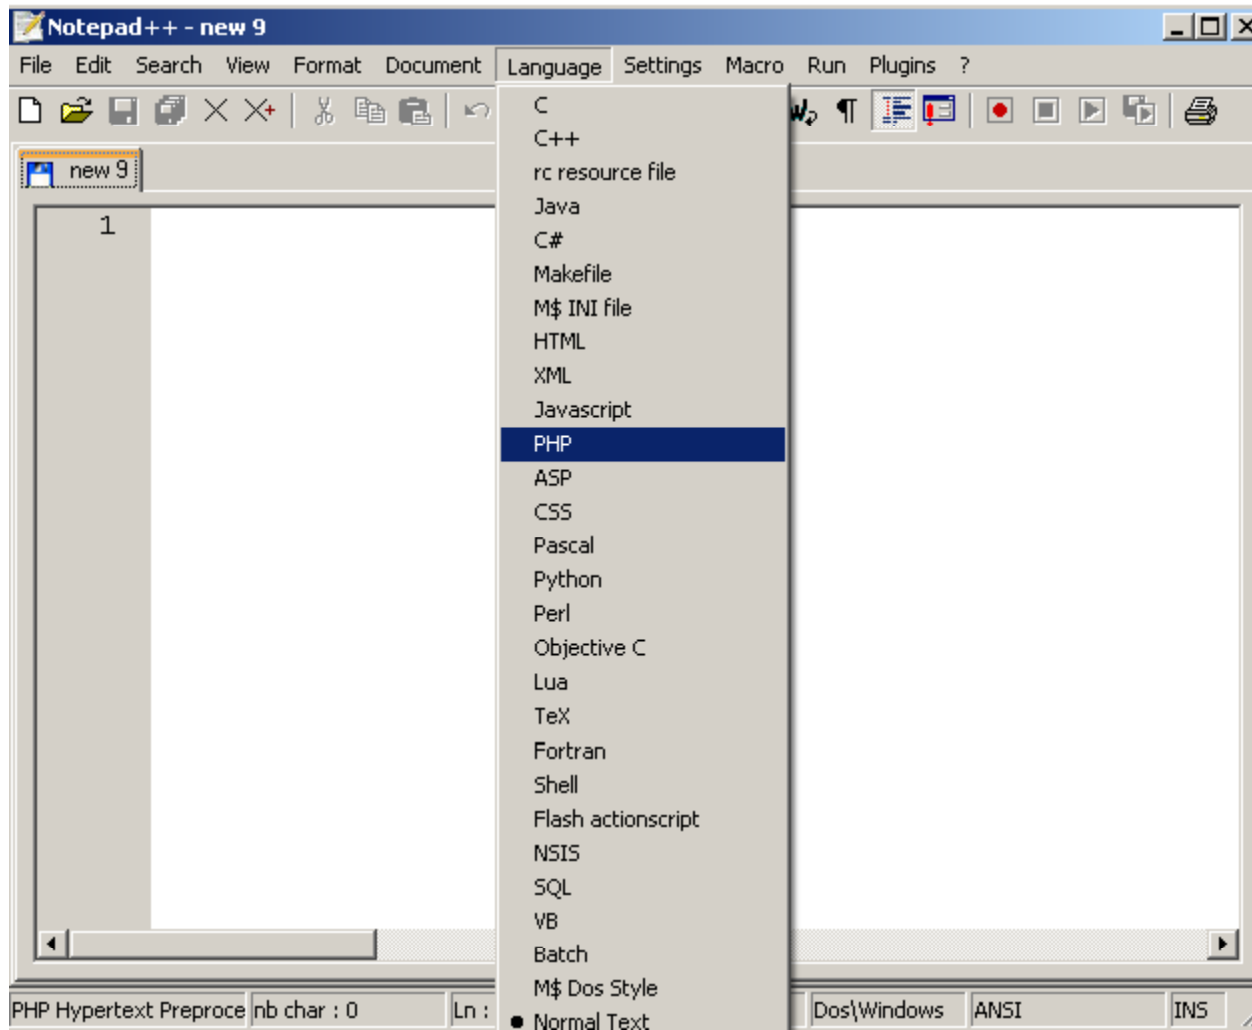

You can't recognize whether it is a simple HTML file or it is generated on the server by a server side language such as PHP, Perl or ASP.

2. PHP Syntax

- A PHP file normally contains HTML tags, just like an HTML file, and some PHP scripting code. A PHP scripting block always starts with `<?php` and ends with `?>`. A PHP scripting block can be placed anywhere in the document.
- Each code line in PHP must end with a semicolon. The *semicolon* is a separator and is used to distinguish one set of instructions from another.

```
<html>  
    <body>  
        <?php ..commands..; ?>  
    </body>  
</html>
```

PHP Syntax (cont.)

PHP Syntax (cont.)

PHP Indicator

```
<?php
```

```
define("_BBCLONE_DIR", "../counter/");
define("COUNTER", _BBCLONE_DIR."mark_page.php");
if (is_readable(COUNTER)) include_once(COUNTER);
```

```
?>
```

```
<?php
```

```
$path = "../../../tpl/";
$domain_path = "../../../include/";
```

```
?>
```

Semicolon

```
<?php
```

```
include "menu.php";
include $path."header.php";
```

```
?>
```

Embedded HTML

```
<!-- Begining of the index - content -->
<table width="100%" height="100%" border="0" cellpadding="0" cellspacing="0">
<tr>
```

```
<!-- Left column - START -->
```

```
<?php
```

```
include $path."column_left.php";
```

```
?>
```

```
<!-- Left column - END -->
```

3. PHP *echo*

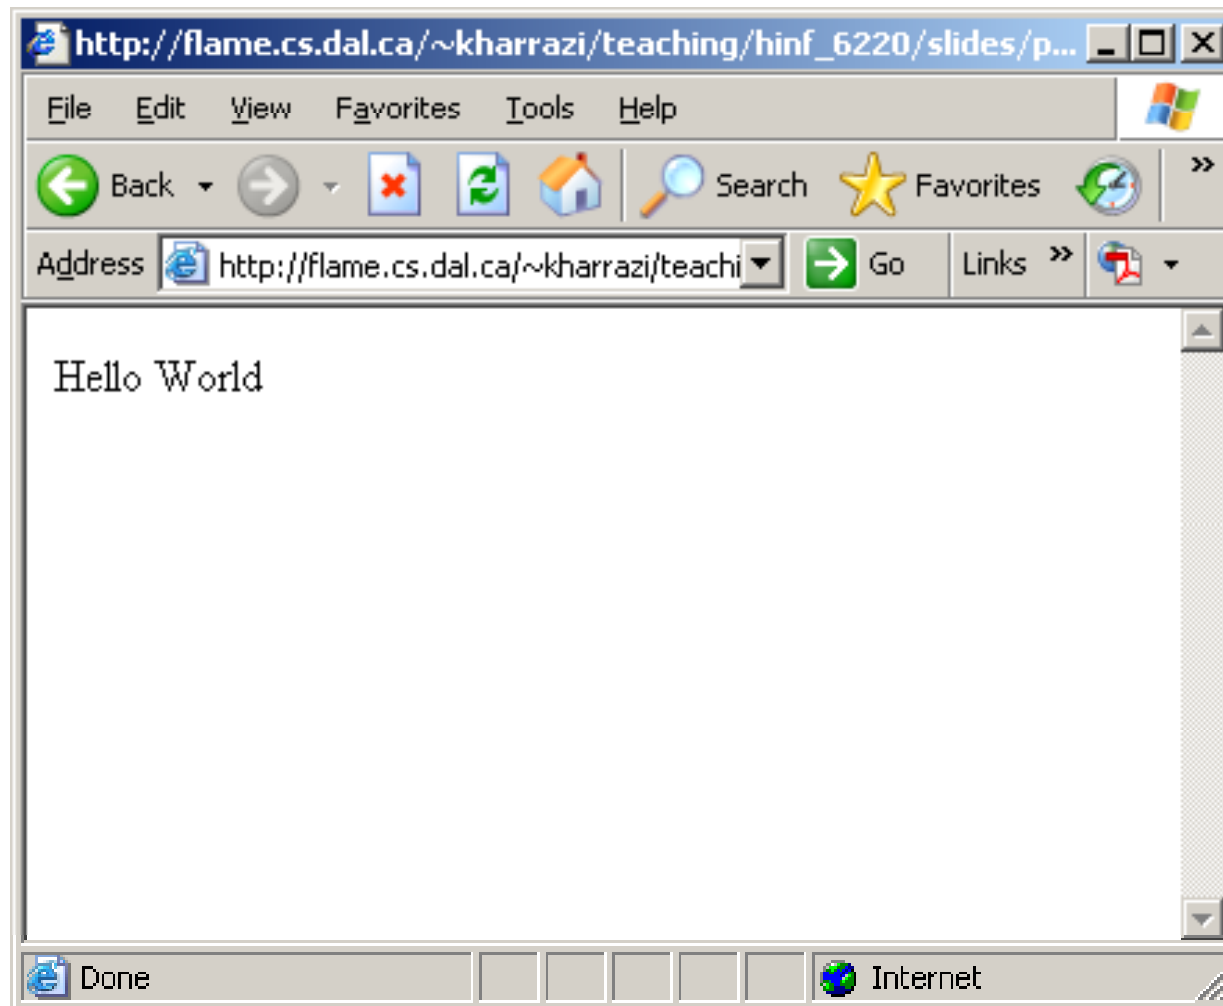

echo

- There are two basic statements to output text with PHP: *echo* and *print*. `echo()` is not actually a function (it is a language construct), so you are **not** required to use parentheses with it.

```
<html>  
    <body>  
        <?php  
            echo "Hello World";  
        ?>  
    </body>  
</html>
```

PHP echo (cont.)

echo

PHP echo (cont.)

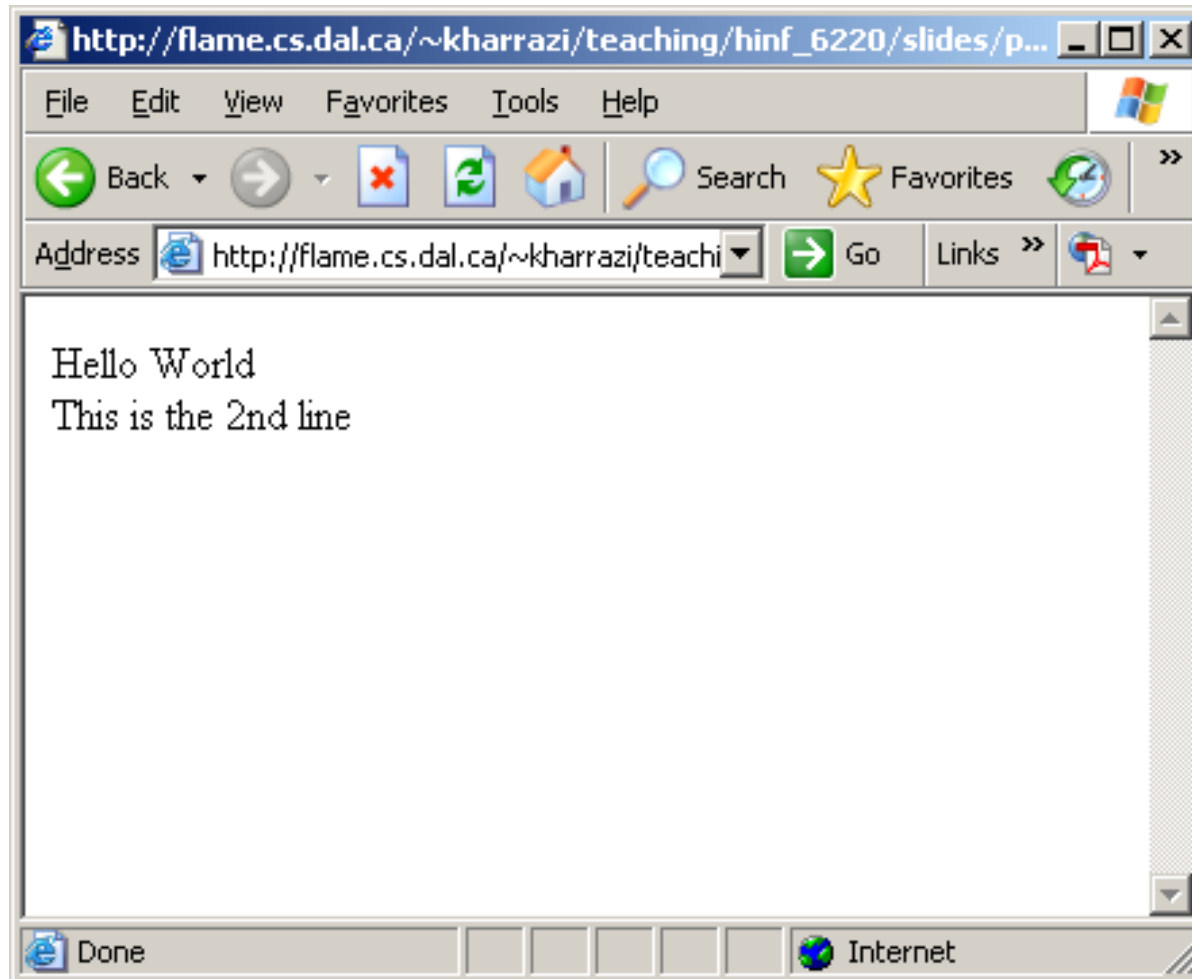

echo

- HTML tags can be constructed in PHP echo statement. In the following case the `
` tag is made by the PHP script and will be interpreted by the browser to make a new line in HTML.

```
<html>
  <body>
    <?php
      echo "Hello World";
      echo "<br>";
      echo "This is the 2nd line";
    ?>
  </body>
</html>
```

PHP echo (cont.)

echo

PHP echo (cont.)

echo

- You can create all of the HTML tags by the PHP script but it will be hard to read the code efficiently. This is exactly why Perl's syntax (another server side language) is hard to script and read!

```
<?php
    echo "<html>";
    echo "<body>";
    echo "Hello World";
    echo "<br>";
    echo "This is the 2nd line"
    echo "</body>";
    echo "</html>";
?>
```

PHP echo (cont.)

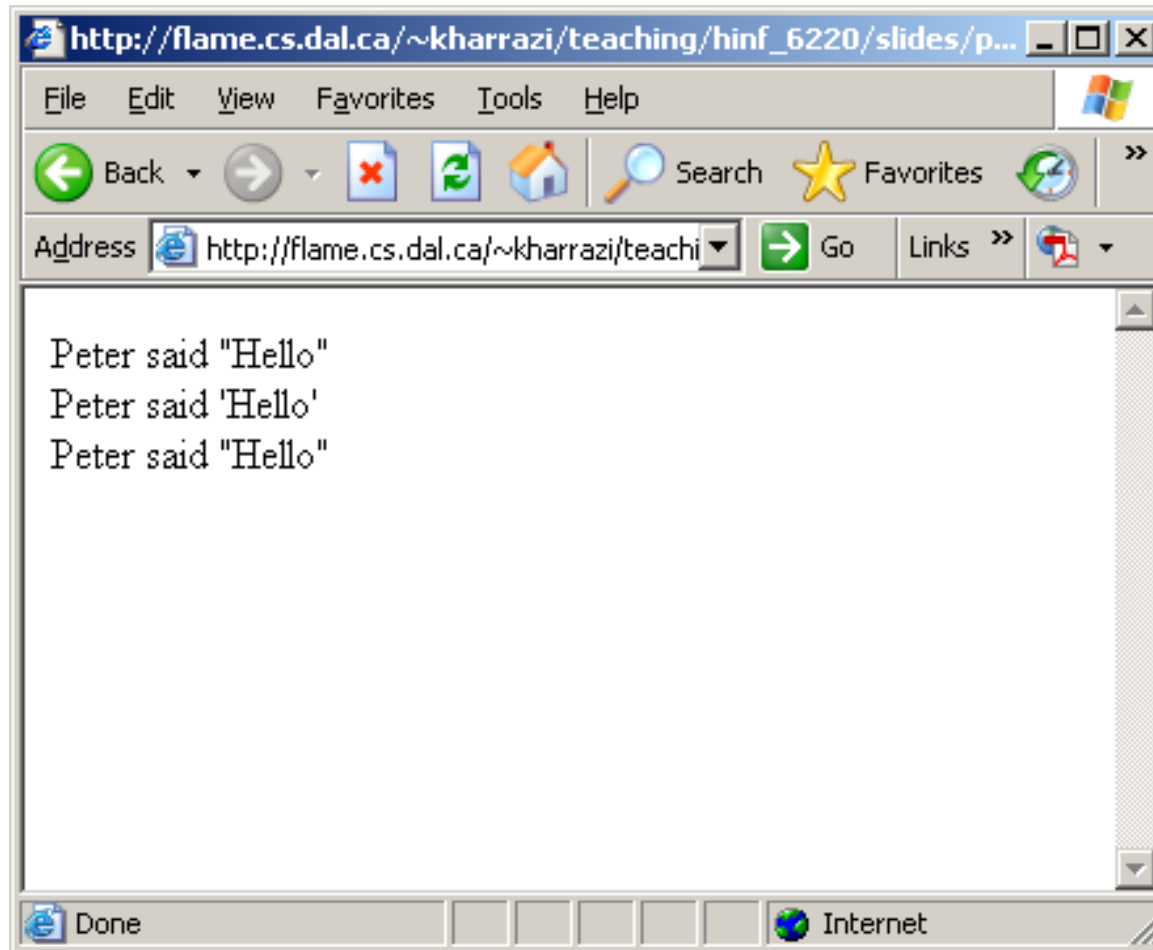

echo

- In order to echo a double quote (") or single quote (') we can either use them following by a back slash (\) or changing the main quote sign from double to single or vice versa.

```
<?php
    echo "Peter said \"Hello\"";
    echo "<br>";
    echo "Peter said 'Hello'";
    echo "<br>";
    echo 'Peter said "Hello"';
?>
```

PHP echo (cont.)

echo

PHP echo (cont.)

echo

- In order to echo a block of text the following syntax can be used. An indicator (here END) should be used to show the start and end of the text block. Note that the END indicator should be at the beginning of the line in the code. Quotes can be used in this syntax.

```
<?php
```

```
echo <<<END
```

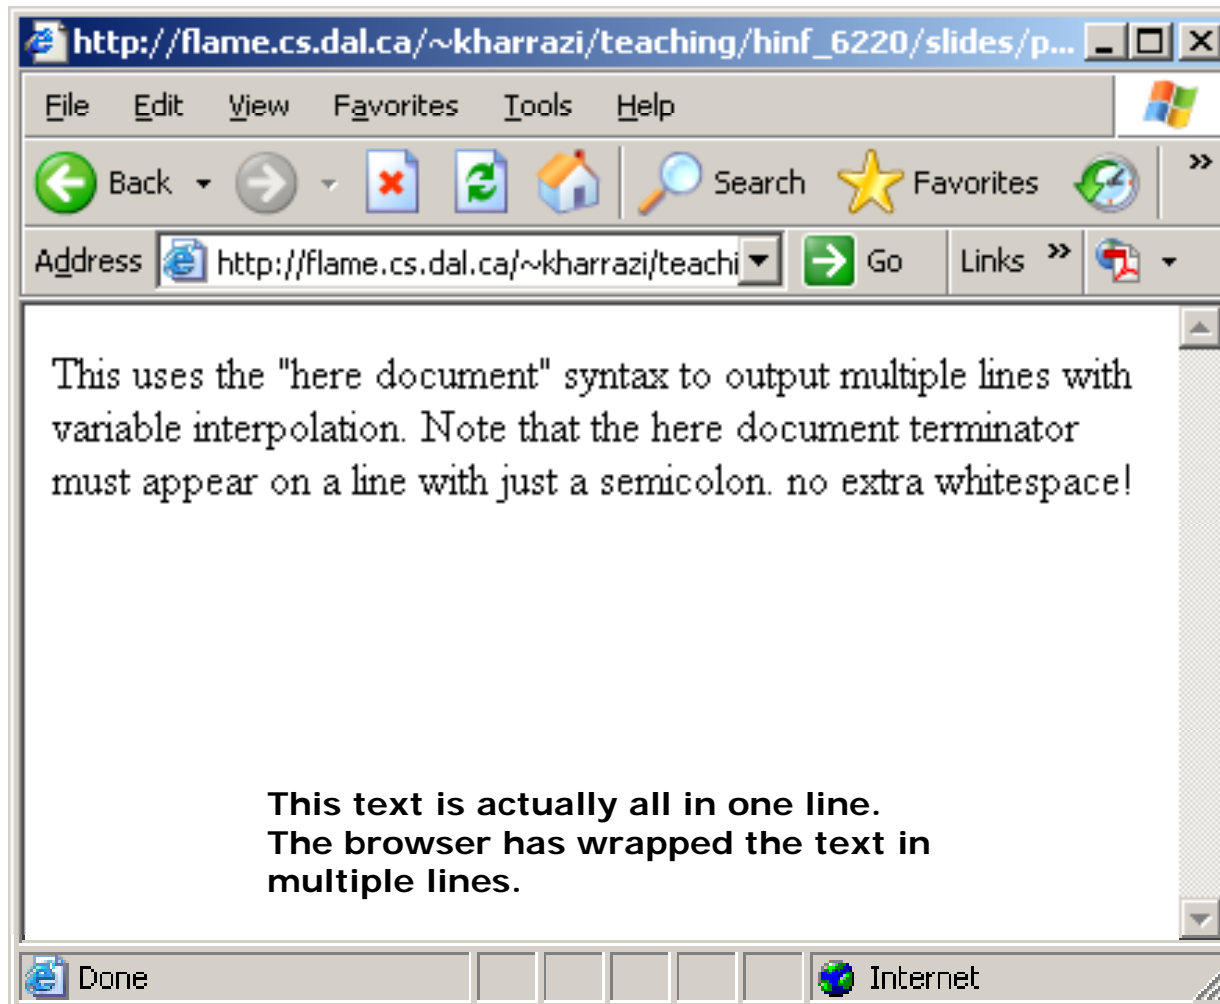

```
This uses the "here document" syntax to output  
multiple lines with variable interpolation. Note  
that the here document terminator must appear on a  
line with just a semicolon. no extra whitespace!
```

```
END;
```

```
?>
```

PHP echo (cont.)

echo

PHP echo (cont.)

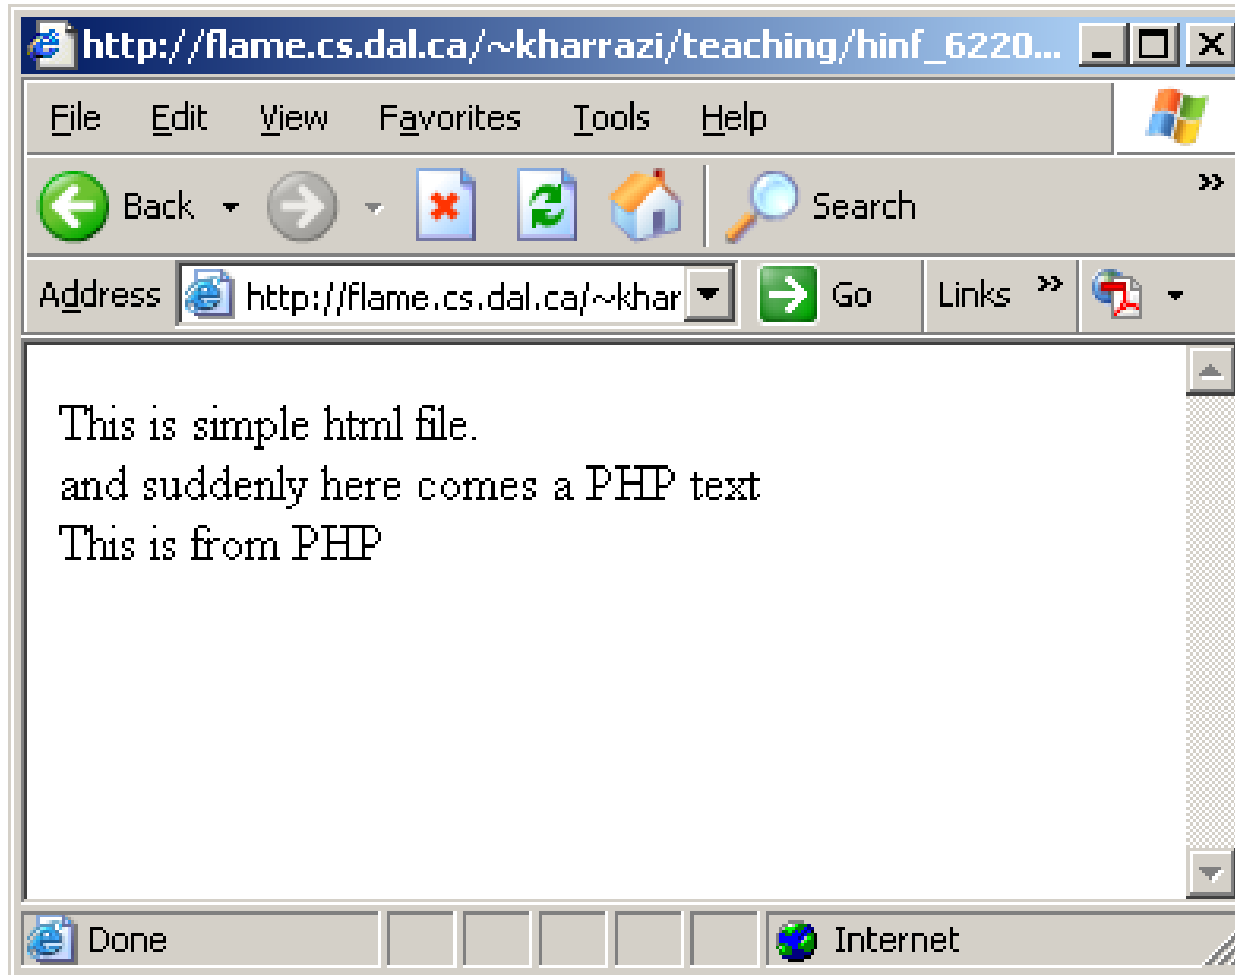

echo

- echo() also has a shortcut syntax, where you can immediately follow the opening tag with an equals sign without the PHP name. This short syntax only works with the *short_open_tag* configuration setting enabled.

```
<html>
  <body>
    This is simple html file.
    <br>
    and suddenly here comes a PHP text
    <br>
    <?="This is from PHP"?>
  </body>
</html>
```

PHP echo (cont.)

echo

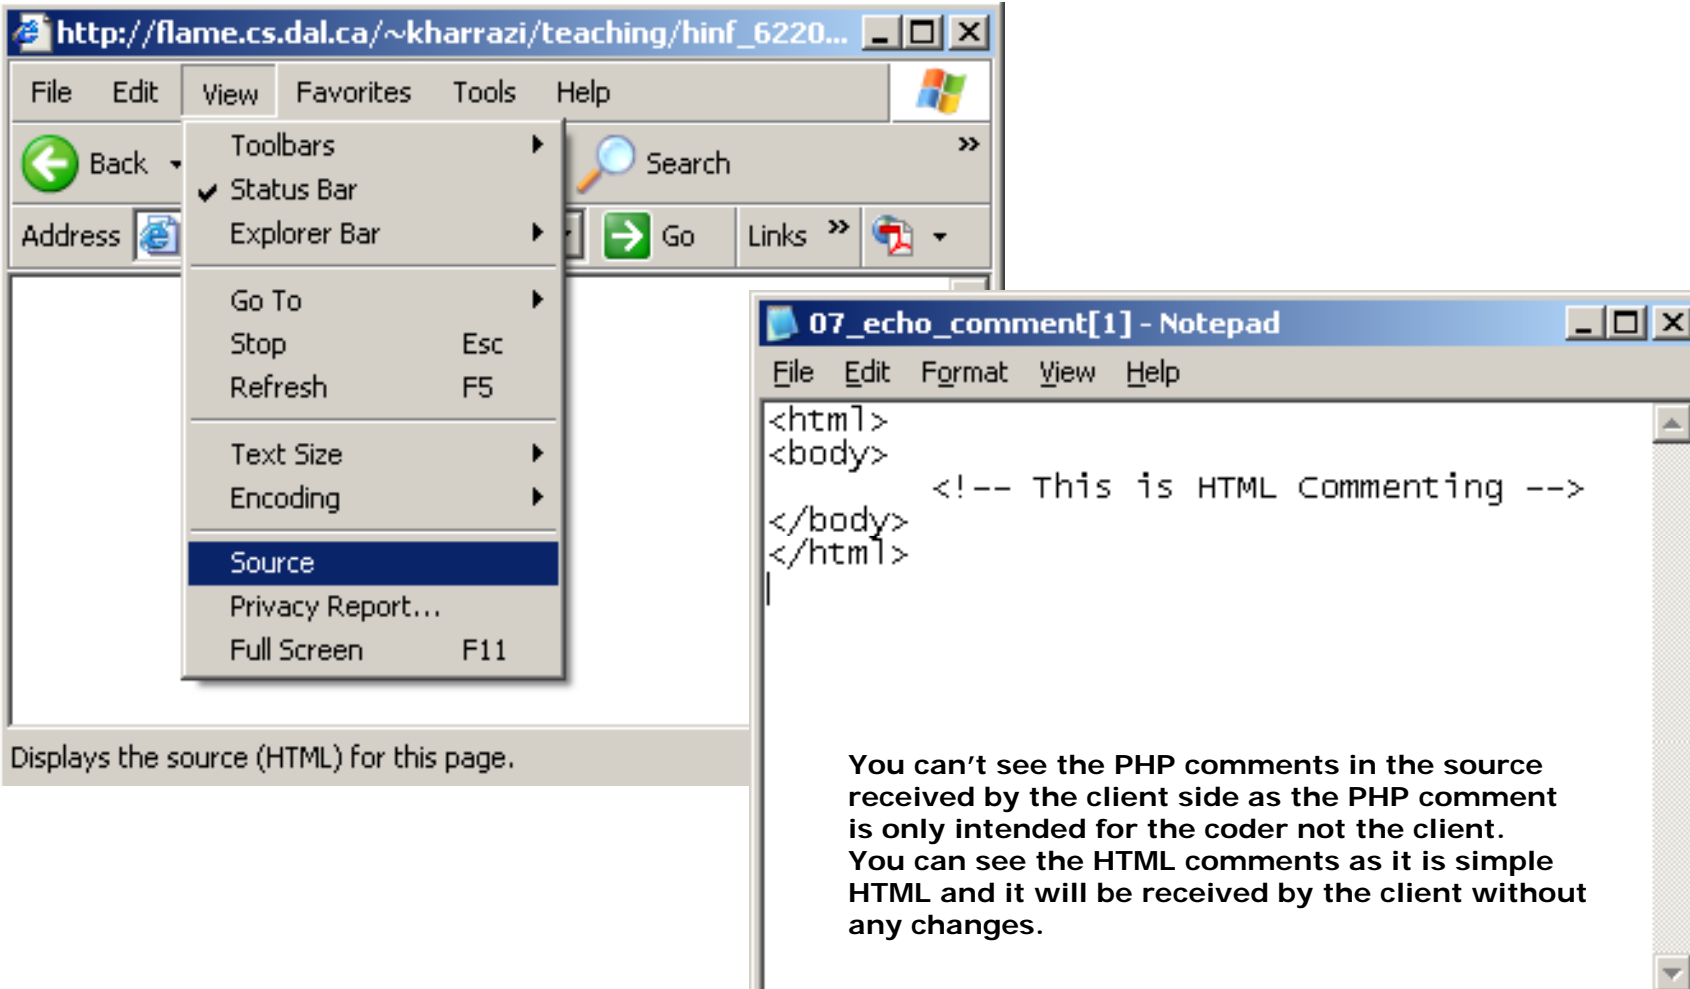

3. PHP Commenting

- In PHP, we use // to make a single-line comment or /* and */ to make a large comment block.

```
<html>
<body>
  <!-- This is HTML Commenting -->
  <?php
    //This is a PHP comment

    /*
    This is a PHP
    comment block
    */
  ?>
</body>
</html>
```

PHP Commenting (cont.)

Displays the source (HTML) for this page.

```

<html>
<body>
    <!-- This is HTML Commenting -->
</body>
</html>

```

You can't see the PHP comments in the source received by the client side as the PHP comment is only intended for the coder not the client. You can see the HTML comments as it is simple HTML and it will be received by the client without any changes.

4. PHP Variables

- All variables in PHP start with a \$ sign symbol. Variables may contain different data types. PHP supports the following data types:
 - *Integer*: Used for whole numbers
 - *Double*: Used for real numbers
 - *String*: Used for strings of characters
 - *Boolean*: Used for true or false values
 - *Array*: Used to store multiple data items of the same type
 - *Object*: Used for storing instances of classes

} **Numbers**

```
<?php
    $x = ...
?>
```

PHP Variables (cont.)

- Variables are variable! That means variables can change through a script and accept new values unless they are defined as *constants*.
- In the following example \$x will be 5 at the end of the script:

```
<?php  
    $x = 2;  
    $x = 5;  
?>
```

PHP Variables:String (cont.)

string

- To indicate that a variable is a string you can double quote the variables content:

```
<?php
    $x = "This is a string";
    $y = "12345";
?>
```

- Therefore \$y="12345" is a string not a number.

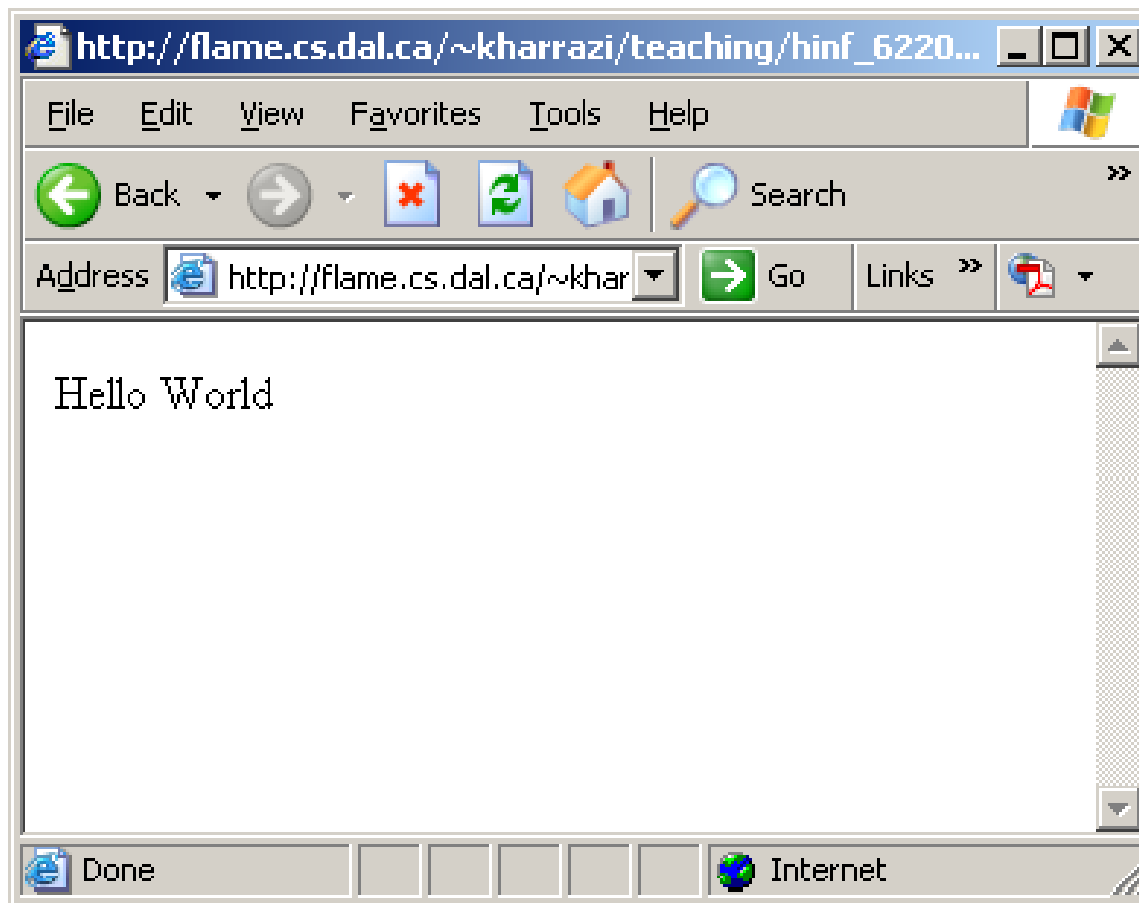

PHP Variables:String (cont.)

string

```
<?php
    $x = "Hello World";
    echo $x;
?>
```

PHP Variables:String (cont.)

string

PHP Variables:String (cont.)

string

- To concatenate two or more string variables together, use the dot (.) operator:

```
<?php
    $x.$y
?>
```

PHP Variables:String (cont.)

string

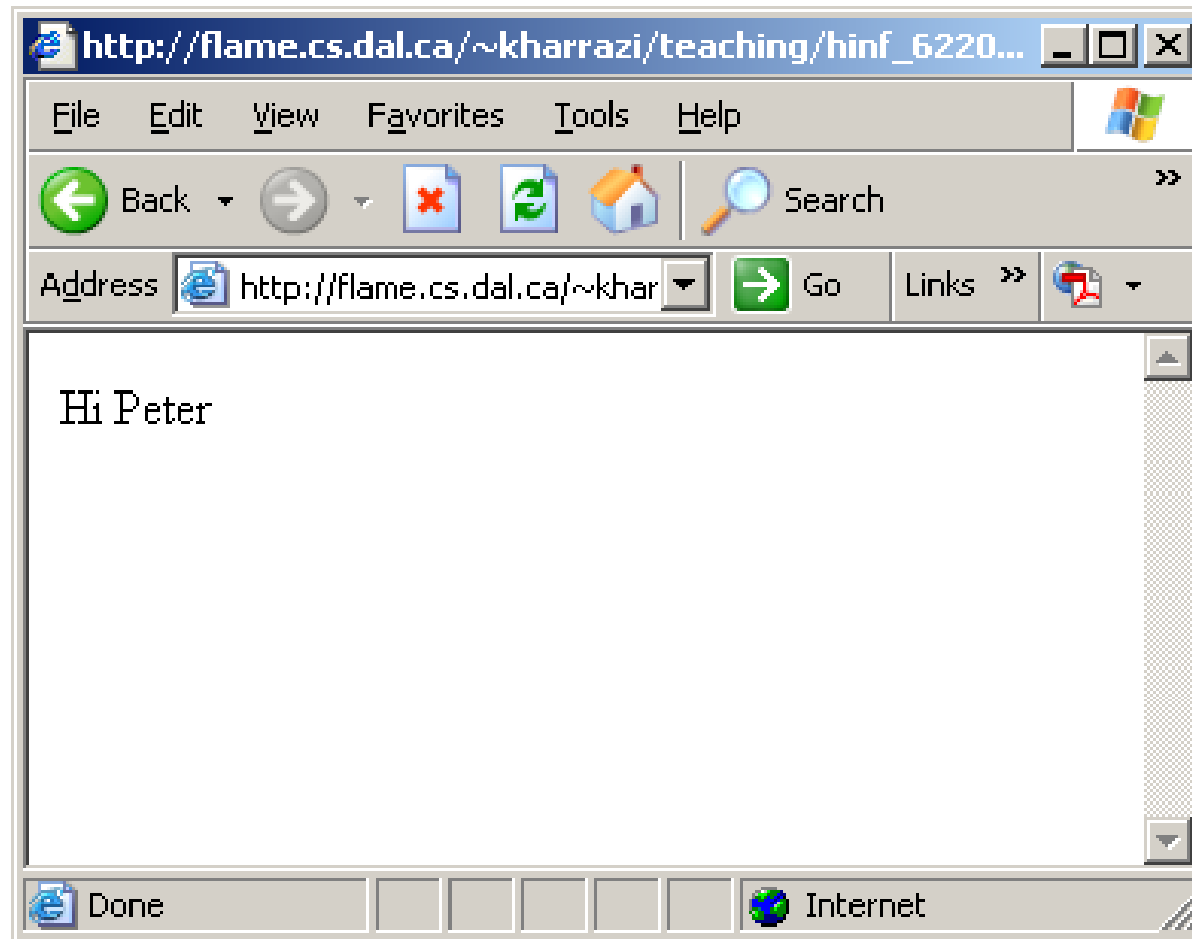

```
<?php
    $x = "Hi ";
    $y = "Peter";
    echo $x.$y;
?>
```

Or we could write:

```
<?php
    $x = "Hi ";
    $y = "Peter";
    $z = $x.$y;
    echo $z;
?>
```

PHP Variables:String (cont.)

string

PHP Variables:String (cont.)

string

```
<?php
```

```
    $var1 = "Please indicate your name.";
```

```
    $var2 = "<br>";
```

```
    $var3 = "<form action='../html/print_data.php'  
method='post'>";
```

```
    $var4 = "<input type='text' name='firstname'>";
```

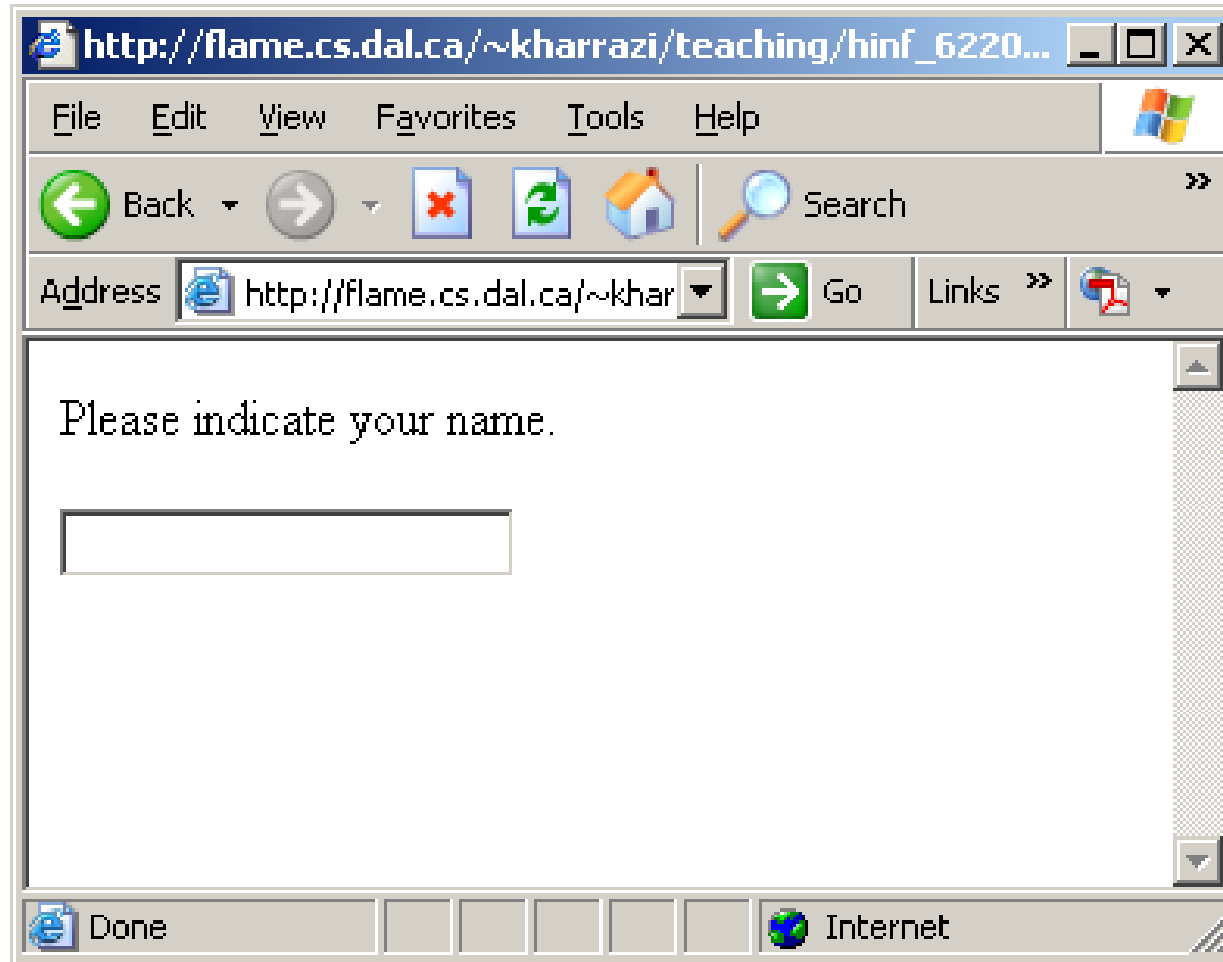

```
    $var5 = "</form>";
```

```
    echo $var1.$var2.$var3.$var4.$var5;
```

```
?>
```

PHP Variables:String (cont.)

string

PHP Variables:String (cont.)

string

Or we could write:

```
<?php
    $var = "Please indicate your name.";
    $var = $var . "<br>";
    $var = $var . "<form action='../html/print_data.php'
method='post'>";
    $var = $var . "<input type='text' name='firstname'>";
    $var = $var . "</form>";
    echo $var;
?>
```

PHP Variables:String (cont.)

string

Or we could write:

```
<?php
```

```
$var = "Please indicate your name.";
$var .= "<br>";
$var .= "<form action='../html/print_data.php'
method='post'>";
$var .= "<input type='text' name='firstname'>";
$var .= "</form>";
echo $var;
```

```
?>
```

Shortcut

```
$x = $x . "Some String";
$x.= "Some String";
```

PHP Variables:String (cont.)

string

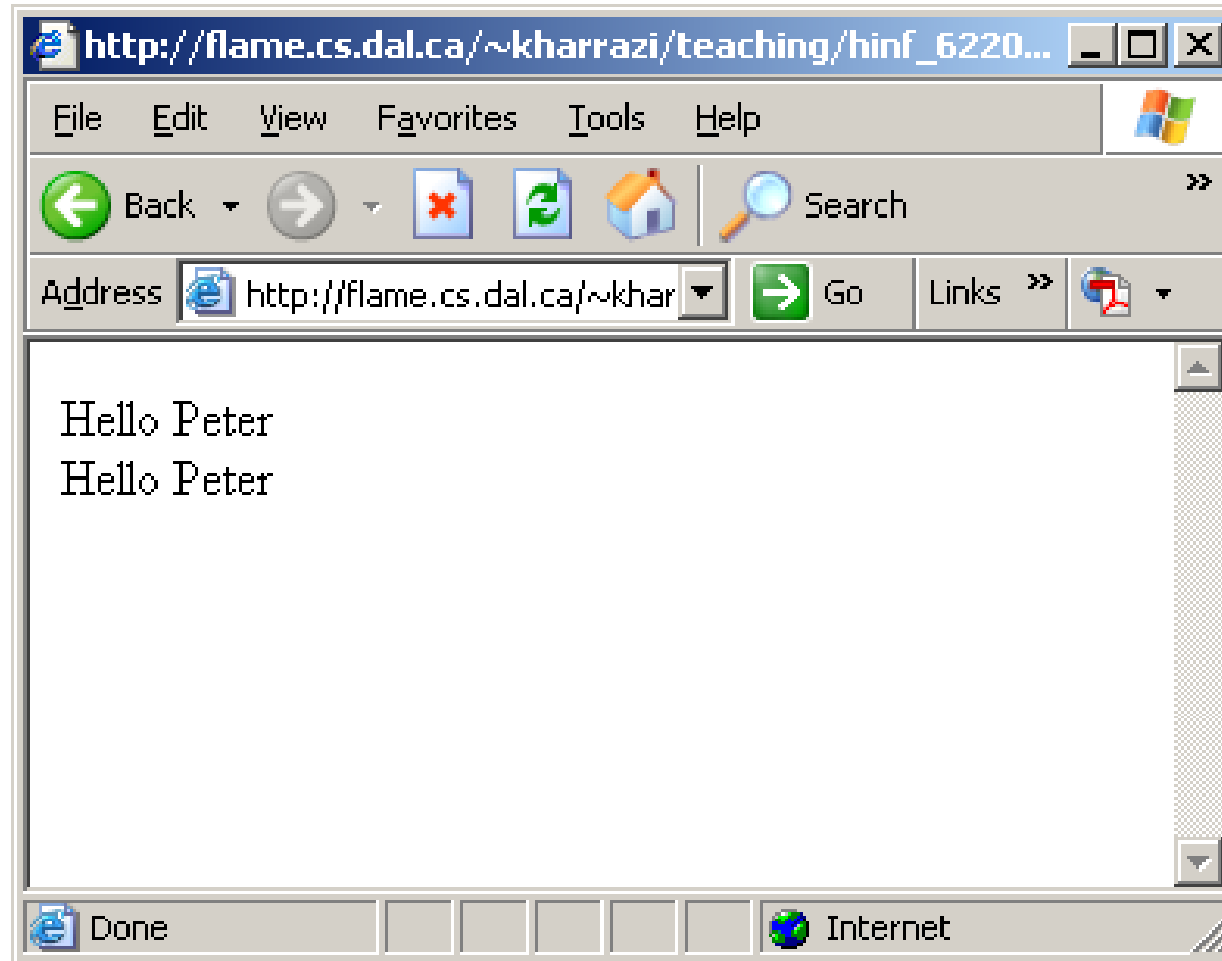

- You can use the variable name inside a quoted string. PHP is smart enough to interpret the variable:

```
$x = "My name";  
echo "Some String $x";
```

```
<?php  
    $var = "Peter";  
    echo "Hello " . $var;  
    echo "<br>";  
    echo "Hello $var";  
?>
```

PHP Variables:String (cont.)

string

PHP Variables: Number (cont.)

number

- Numbers could be either integer or double (float with decimals). PHP is smart enough to recognize any situation and can change the number types to each other. In the following example \$x is a float number while \$y is an integer. Finally \$z is the sum of \$x and \$y (sum of float and integer) and PHP defines \$z as an float automatically.

```
<?php
    $x = 12.02;
    $y = 45;
    $z = $x + $y;
?>
```

PHP Variables: Number (cont.)

number

```
<?php
```

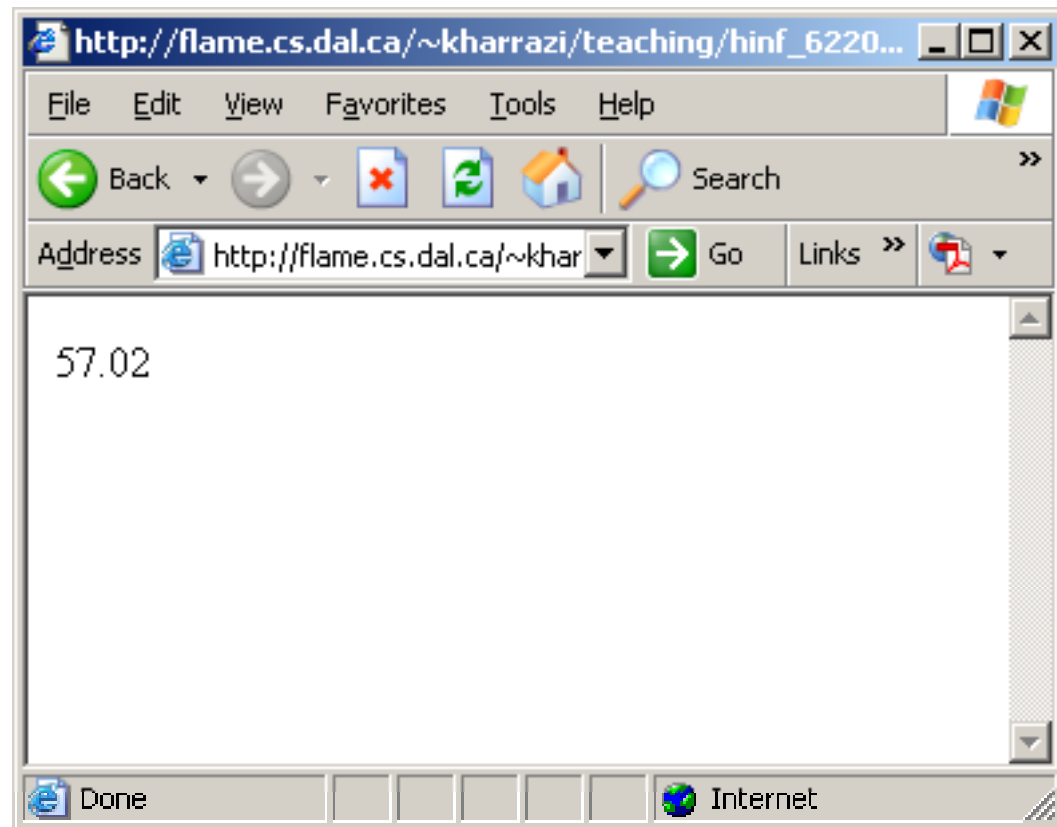

```
    $x = 12.02;
```

```
    $y = 45;
```

```
    $z = $x + $y;
```

```
    echo $z;
```

```
?>
```

PHP Variables: Number (cont.)

number

- Arithmetic Operators:

Operator	Description	Example	Result (echo \$y)
+	Addition	<code>\$x=12; \$y = \$x + 5;</code>	17
-	Subtraction	<code>\$x=12; \$y = \$x - 5;</code>	9
*	Multiplication	<code>\$x=12; \$y = \$x * 5;</code>	60
/	Division	<code>\$x=12; \$y = \$x / 5;</code>	2.4
%	Modulus	<code>\$x=12; \$y = \$x % 5;</code>	2
++	Increment	<code>\$y=12; \$y++; (++\$y)</code>	13
--	Decrement	<code>\$y=12; \$y--; (--\$y)</code>	11

PHP Variables: Number (cont.)

number

```
<?php
```

```
    $a = 12; $b = 45; $c = 5;
```

```
    echo "a = $a";
```

```
    echo "b = $b";
```

```
    echo "c = $c";
```

```
    echo "a + b = " . ($a + $b);
```

```
    echo "a - b = " . ($a - $b);
```

```
    echo "a / b = " . ($a / $b);
```

```
    echo "a * b = " . ($a * $b);
```

```
    echo "a % c = " . ($a % $c);
```

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

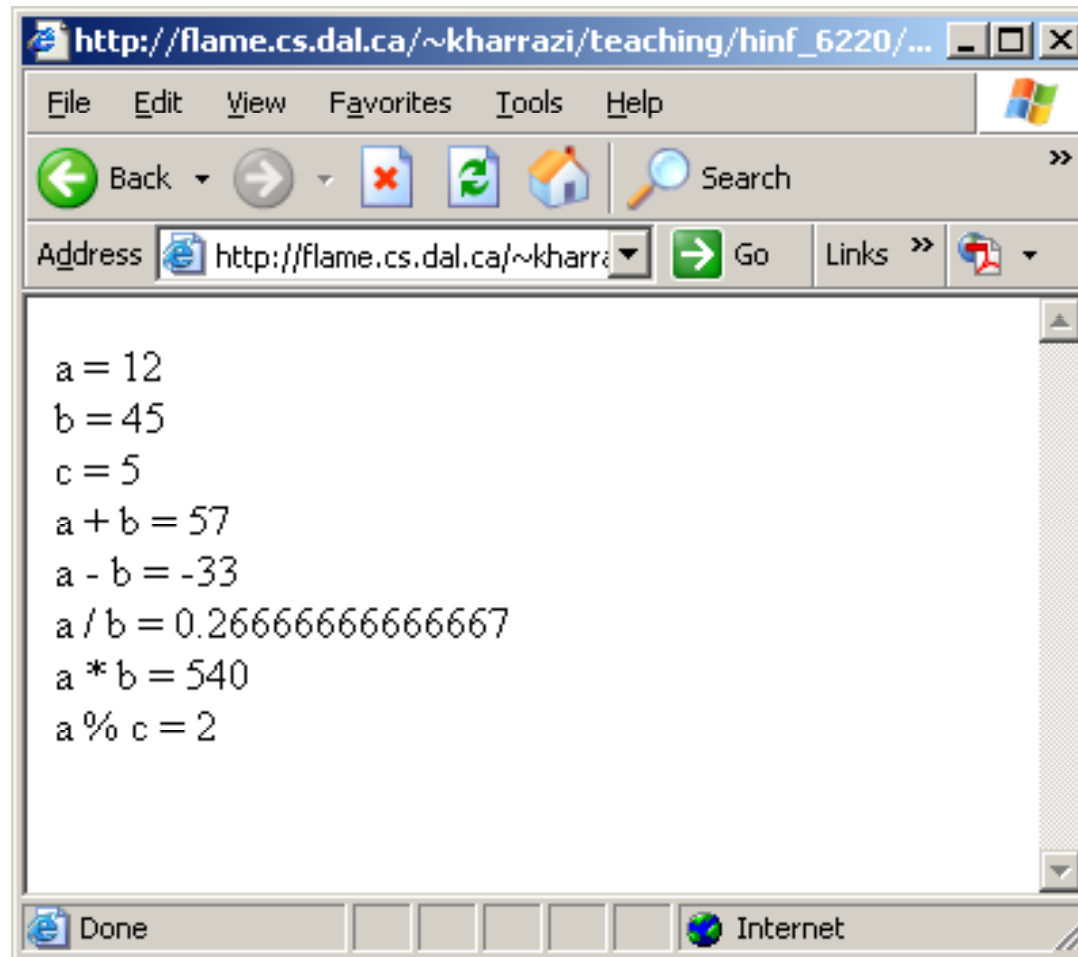

```
    echo "<br>";
```

```
?>
```

? Regular Expression

PHP Variables: Number (cont.)

number

The screenshot shows a web browser window with the address bar containing `http://flame.cs.dal.ca/~kharrazi/teaching/hinf_6220/...`. The browser's menu bar includes File, Edit, View, Favorites, Tools, and Help. The navigation bar features Back, Forward, Stop, Refresh, Home, and Search buttons. The address bar has a dropdown menu showing `http://flame.cs.dal.ca/~kharrazi` and a Go button. The main content area displays the following PHP arithmetic results:

```
a = 12
b = 45
c = 5
a + b = 57
a - b = -33
a / b = 0.2666666666666667
a * b = 540
a % c = 2
```

The status bar at the bottom shows "Done" and "Internet".

PHP Variables: Number (cont.)

number

```
<?php
```

```
    $a = 10; $b = 15; $c = 20;
```

```
    echo "a = $a";
```

```
    echo "b = $b";
```

```
    echo "c = $c";
```

```
    // a
```

```
    echo "a++ = " . ($a++);
```

```
    // b
```

```
    $b++;
```

```
    echo "b++ = " . $b;
```

```
    // c
```

```
    echo "++c = " . (++$c);
```

```
?>
```

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

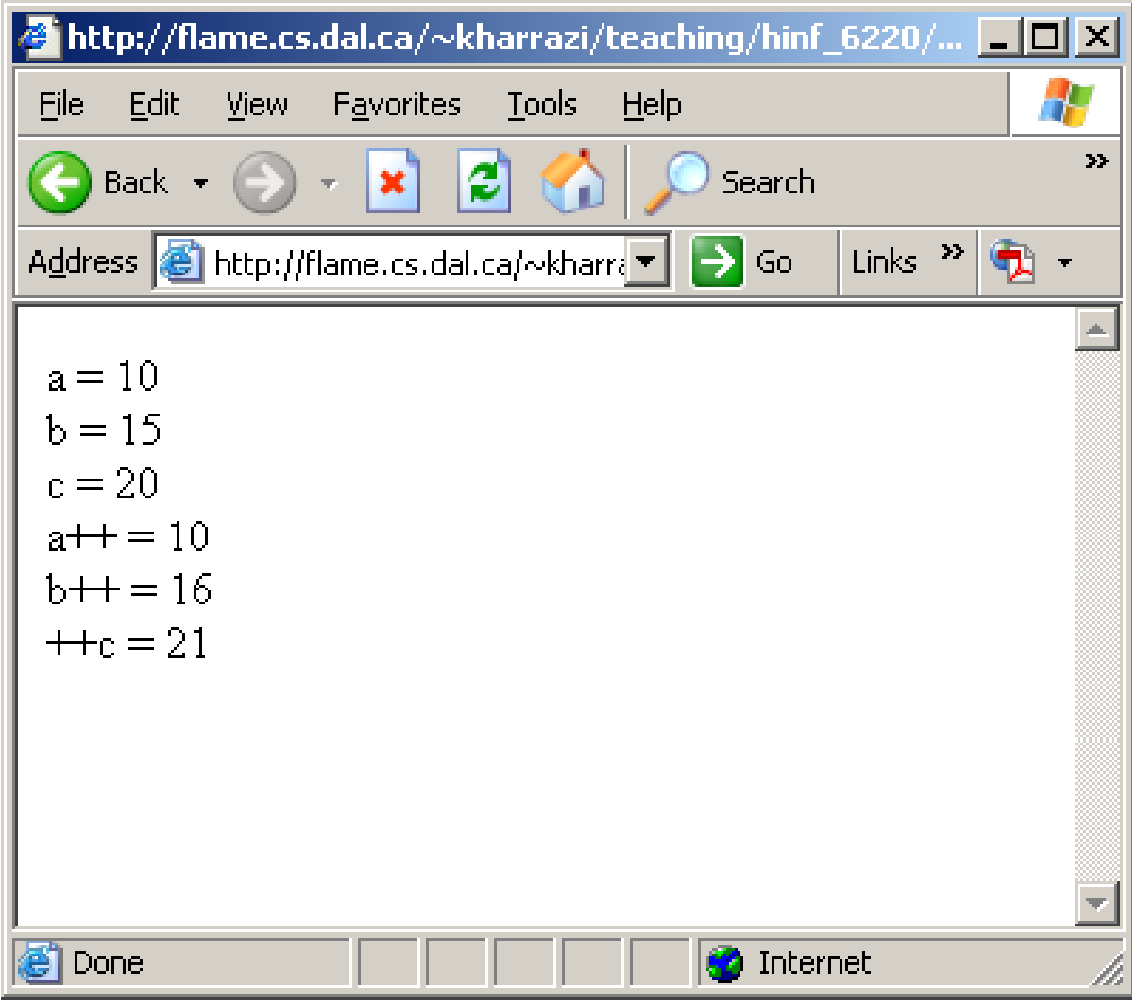

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

PHP Variables: Number (cont.)

number

The screenshot shows a web browser window with the address bar containing `http://flame.cs.dal.ca/~kharrazi/teaching/hinf_6220/...`. The browser's menu bar includes File, Edit, View, Favorites, Tools, and Help. The address bar also features a search icon and a 'Go' button. The main content area displays the following PHP code:

```
a = 10
b = 15
c = 20
a++ = 10
b++ = 16
++c = 21
```

The status bar at the bottom of the browser window shows 'Done' and 'Internet'.

PHP Variables: Number (cont.)

number

- Assignment Operators:

Operator	Example	Result (echo \$y)
=	<code>\$y = 5;</code>	5
+=	<code>\$y = 5; \$y += 10; (\$y = \$y + 10)</code>	15
-=	<code>\$y = 5; \$y -= 10; (\$y = \$y - 10)</code>	-5
*=	<code>\$y = 5; \$y *= 10; (\$y = \$y * 10)</code>	50
/=	<code>\$y = 5; \$y /= 10; (\$y = \$y / 10)</code>	.5
%=	<code>\$y = 15; \$y %= 10; (\$y = \$y % 10)</code>	5

=	<code>\$x=12; \$y = \$x;</code>	12
+=	<code>\$x = 3; \$y = 6; \$y += \$x; (\$y = \$y + \$x)</code>	9

PHP Variables: Number (cont.)

number

```
<?php
```

```
    $a = 10; $b = 15; $c = 20;
```

```
    echo "a = $a";
```

```
    echo "b = $b";
```

```
    echo "c = $c";
```

```
    $b = $b + $a;
```

```
    echo "b = b + a : " . $b;
```

```
    $c += $a;
```

```
    echo "c += a : " . $c;
```

```
?>
```

```
    echo "<br>";
```

```
    echo "<br>";
```

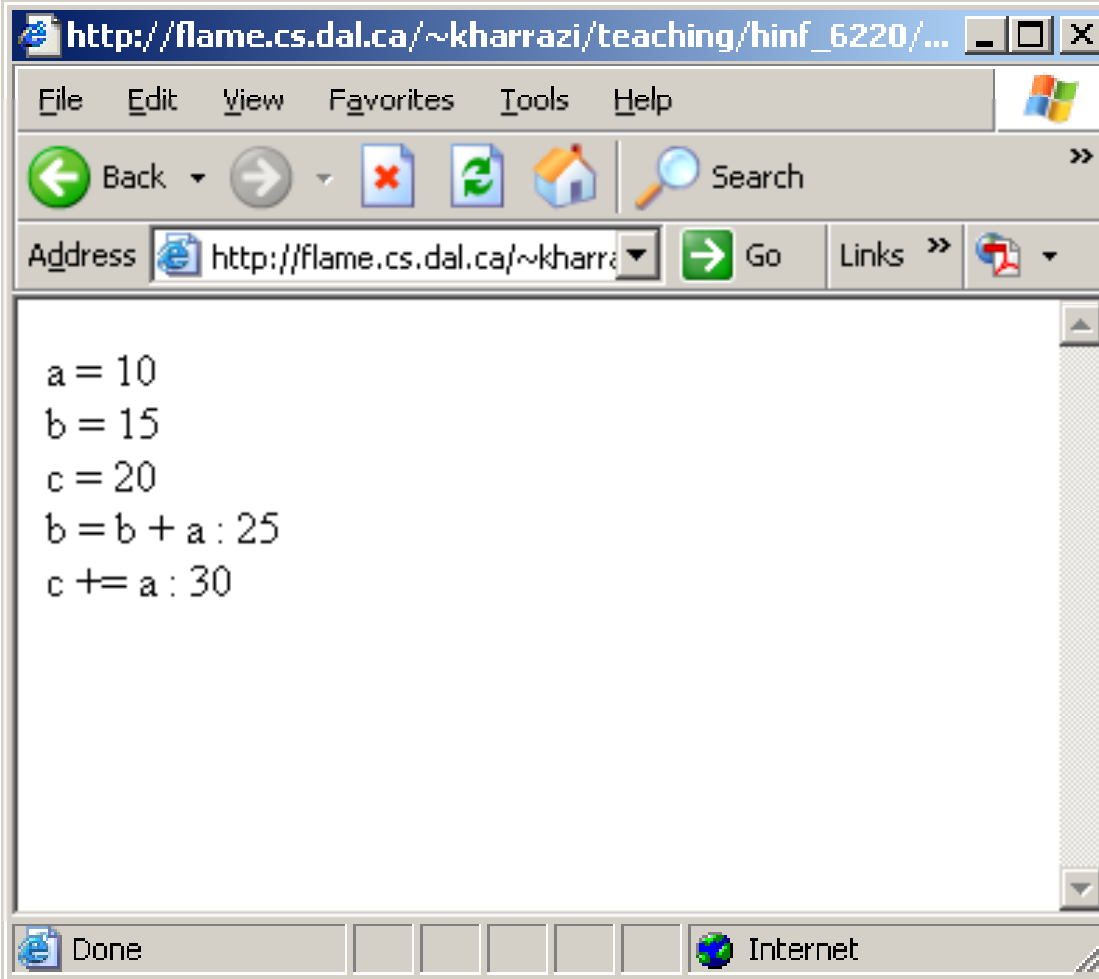

```
    echo "<br>";
```

```
    echo "<br>";
```

```
    echo "<br>";
```

PHP Variables: Number (cont.)

number

The screenshot shows a web browser window with the address bar containing `http://flame.cs.dal.ca/~kharrazi/teaching/hinf_6220/...`. The browser's menu bar includes File, Edit, View, Favorites, Tools, and Help. The toolbar contains Back, Forward, Stop, Refresh, Home, and Search buttons. The address bar shows the current URL and a Go button. The main content area displays the following PHP code output:

```
a = 10  
b = 15  
c = 20  
b = b + a : 25  
c += a : 30
```

The status bar at the bottom shows "Done" and "Internet".

PHP Variables:Array (cont.)

array

- A PHP array is a special data type that can store multiple values in the same variable. The commonly used term for each value is element. Each element can be accessed by the array index, which can be a number or a string. If the index is a string, the array is known as an associative array.
- By default, index values start at zero, and arrays are assumed to be zero-based. This means that the index number of the last element is typically one less than the number of elements. In other words, if an array has four elements, the last value will be referenced as `$my_array[3]`.

PHP Variables:Array (cont.)

array

- These functions allow you to interact with and manipulate arrays in various ways. Arrays are essential for storing, managing, and operating on sets of variables.
- Simple and multi-dimensional arrays are supported, and may be either user created or created by another function. There are specific database handling functions for populating arrays from database queries, and several functions return arrays.

```
<?php
    $x = array(...);
?>
```

PHP Variables:Array (cont.)

array

- PHP arrays have many advantages. First of all, they're flexible. You can store as many items as you need, and work with all of them from one variable.
- In addition, you can work with a single element at a time by using the index value, or you can work with all of the elements. There are many built in PHP functions to help you loop through all the values in the array, count them, shuffle them, sort them, and more.

PHP Variables:Array (cont.)

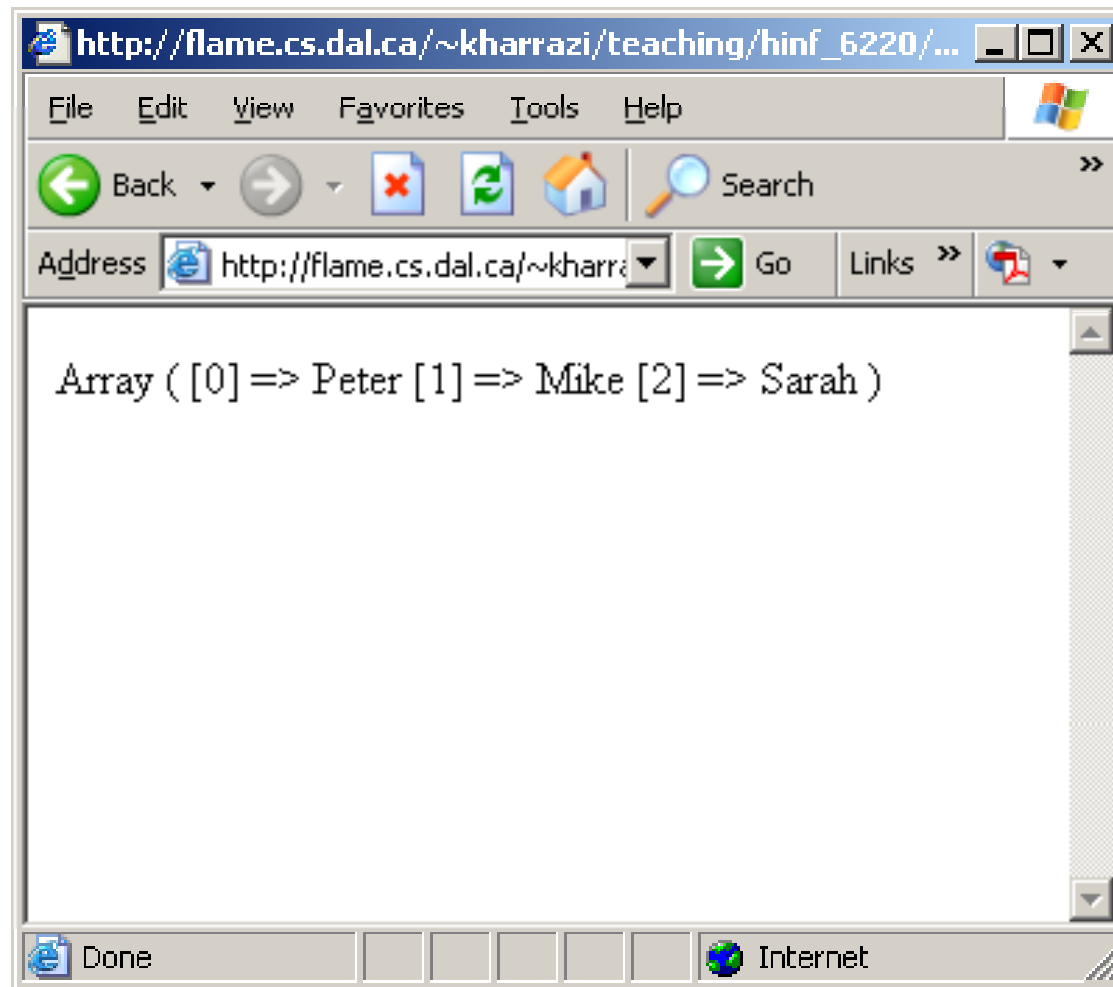

array

```
<?php
    $a = array ('Peter', 'Mike', 'Sarah');

    // print_r will echo array's contents
    print_r($a);
?>
```

PHP Variables:Array (cont.)

array

PHP Variables:Array (cont.)

array

```
<?php
```

```
    $a[0] = 'Peter';
```

```
    $a[1] = 'Mike';
```

```
    $a[2] = 'Sarah';
```

```
    // print_r will echo array's contents
```

```
    print_r($a);
```

```
    echo '<br>';
```

```
    echo 'First Element = ' . $a[0] . '<br>';
```

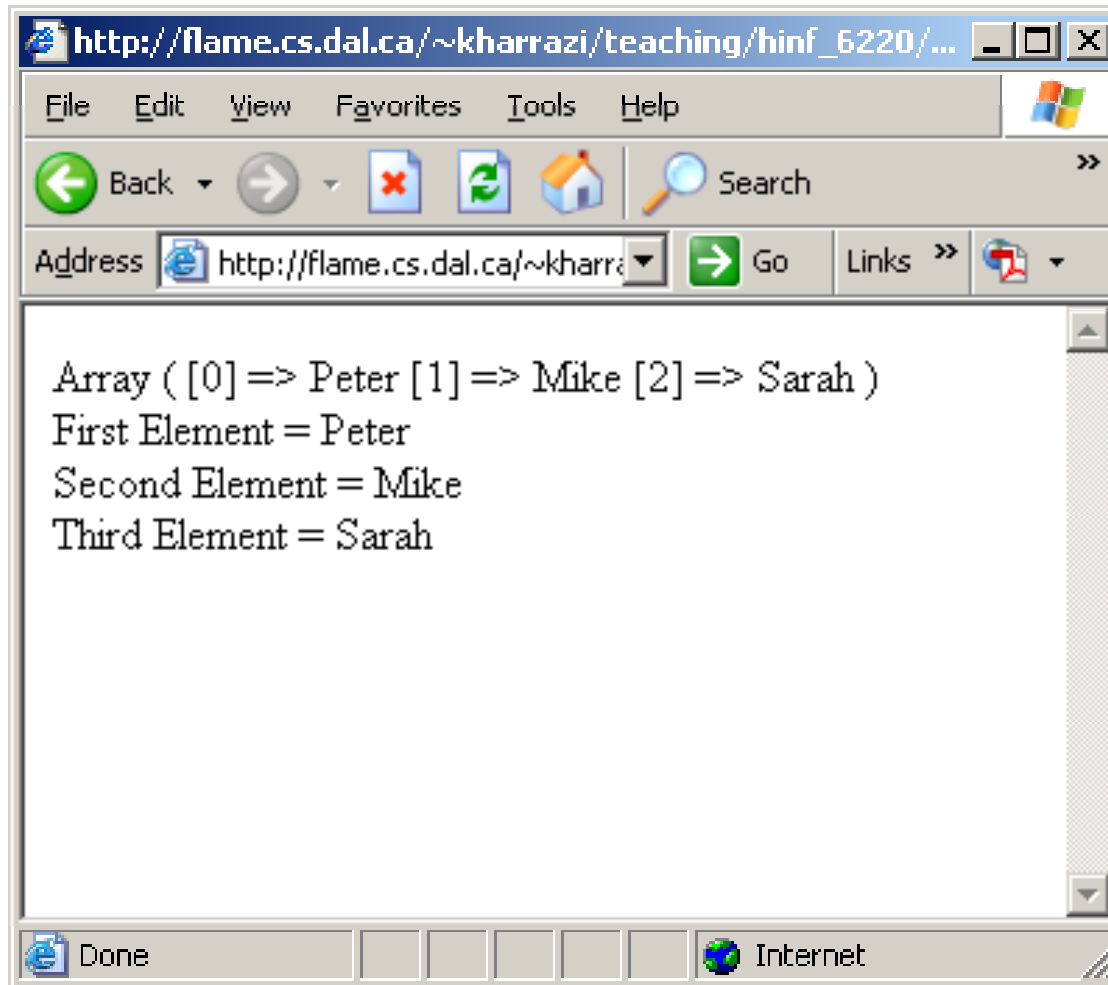

```
    echo 'Second Element = ' . $a[1] . '<br>';
```

```
    echo 'Third Element = ' . $a[2] . '<br>';
```

```
?>
```

PHP Variables:Array (cont.)

array

PHP Variables:Array (cont.)

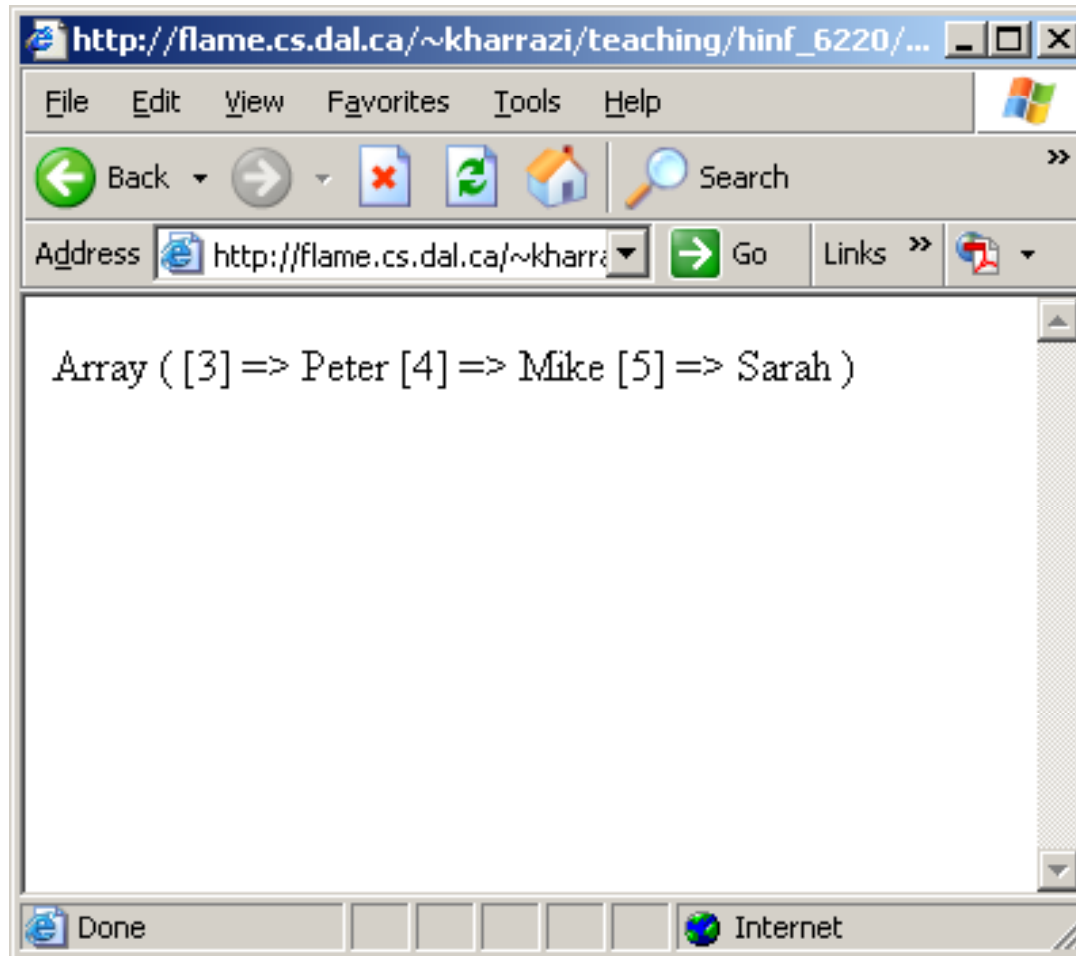

associative array

```
<?php
    $a = array (3 => 'Peter', 4 => 'Mike', 5 => 'Sarah');

    // print_r will echo array's contents
    print_r($a);
?>
```

PHP Variables:Array (cont.)

associative array

PHP Variables:Array (cont.)

associative array

```

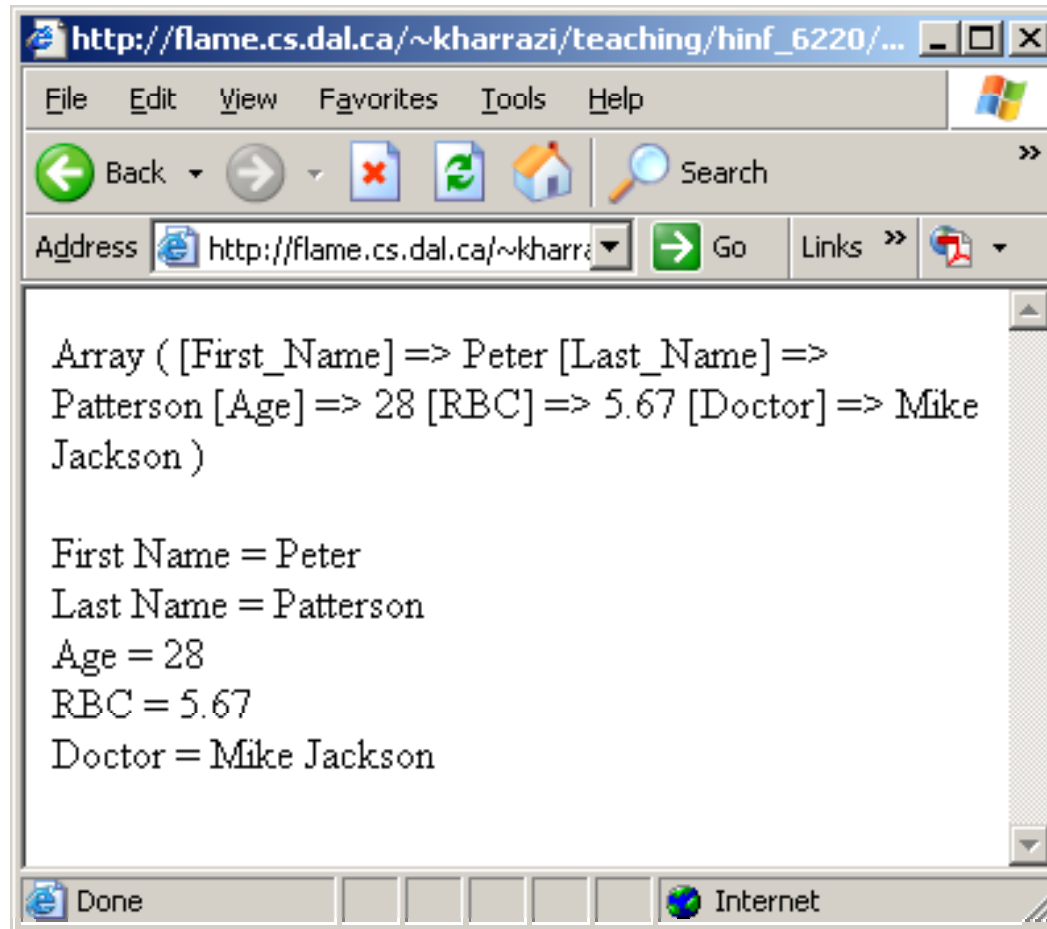

<?php
    $a = array (
        'First_Name'    => 'Peter',
        'Last_Name'     => 'Patterson',
        'Age'           => 28,
        'RBC'           => 5.67,
        'Doctor'        => 'Mike Jackson'
    );

    // print_r will echo array's contents
    print_r($a);
    echo '<br><br>';
    echo 'First Name = ' . $a['First_Name'] . '<br>';
    echo 'Last Name = ' . $a['Last_Name'] . '<br>';
    echo 'Age = ' . $a['Age'] . '<br>';
    echo 'RBC = ' . $a['RBC'] . '<br>';
    echo 'Doctor = ' . $a['Doctor'] . '<br>';
?>

```

PHP Variables:Array (cont.)

associative array

The screenshot shows a web browser window with the address bar containing `http://flame.cs.dal.ca/~kharrazi/teaching/hinf_6220/...`. The browser's content area displays the output of a PHP script, which is an associative array. The output is as follows:

```
Array ( [First_Name] => Peter [Last_Name] =>
Patterson [Age] => 28 [RBC] => 5.67 [Doctor] => Mike
Jackson )

First Name = Peter
Last Name = Patterson
Age = 28
RBC = 5.67
Doctor = Mike Jackson
```

PHP Variables:Array (cont.)

associative array

```
<?php
```

```
    $a = array (  
        'First_Name'    => 'Peter',  
        'Last_Name'    => 'Patterson',  
        'Age'          => 28,  
        'RBC'          => 5.67,  
        'Doctor'       => 'Mike Jackson'  
    );
```

```
    // print_r will echo array's contents
```

```
    print_r($a);
```

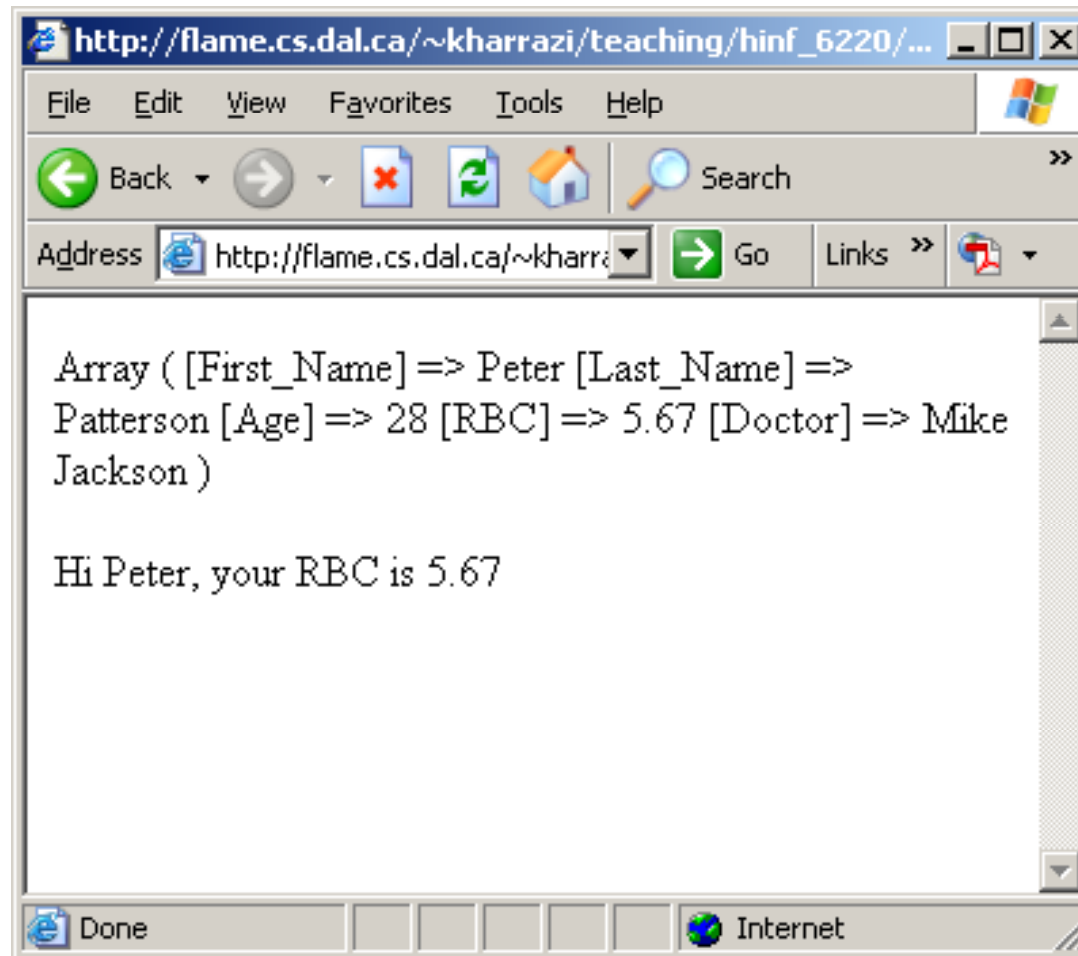

```
    echo '<br><br>';
```

```
    echo "Hi {$a['First_Name']}, your RBC is {$a['RBC']}";
```

```
?>
```

PHP Variables:Array (cont.)

associative array

PHP Variables:Array (cont.)

associative array

```
<?php
```

```
$a = array ( 'Peter', 'Mike', 'Sarah' );
```

```
$b = array ( 23, 45, 19 );
```

```
$c = array ( 'Name' => $a, 'Age' => $b );
```

```
// print_r will echo array's contents
```

```
print_r($c);
```

```
echo '<br><br>';
```

```
echo 'Person 1 = ' . $c['Name'][0] . ' Age = ' .  
$c['Age'][0] . '<br>';
```

```
echo 'Person 2 = ' . $c['Name'][1] . ' Age = ' .  
$c['Age'][1] . '<br>';
```

```
echo 'Person 3 = ' . $c['Name'][2] . ' Age = ' .  
$c['Age'][2] . '<br>';
```

```
?>
```

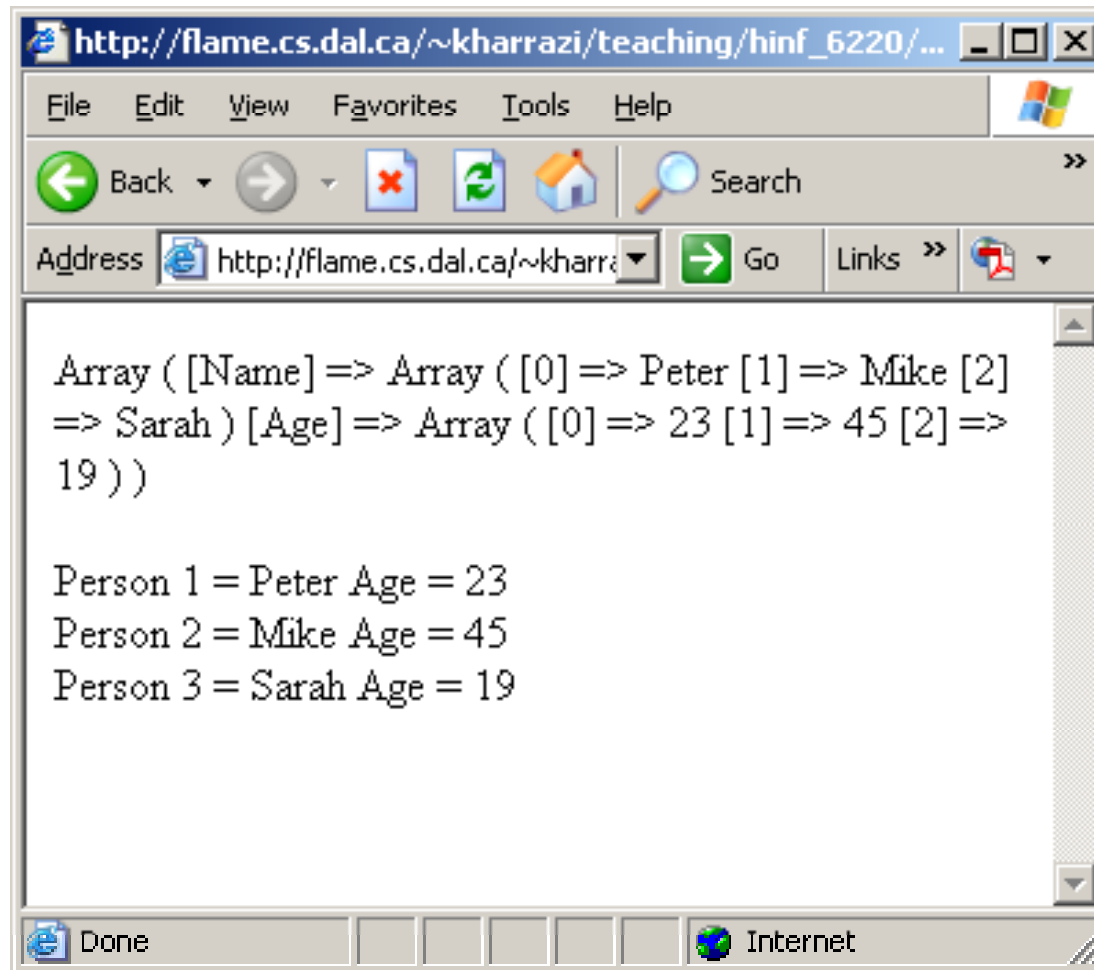

PHP Variables:Array (cont.)

associative array

\$c	\$a, \$b Element 1	\$a, \$b Element 2	\$a, \$b Element 3
\$c Element1 \$c ['Name'] \$a	Peter \$c ['Name'][0]	Mike \$c ['Name'][1]	Sarah \$c ['Name'][2]
\$c Element 2 \$c ['Age'] \$b	23 \$c ['Age'][0]	45 \$c ['Age'][1]	19 \$c ['Age'][2]

PHP Variables:Array (cont.)

associative array

A screenshot of a web browser window. The address bar shows the URL 'http://flame.cs.dal.ca/~kharrazi/teaching/hinf_6220/...'. The browser's menu bar includes 'File', 'Edit', 'View', 'Favorites', 'Tools', and 'Help'. Below the menu bar is a navigation bar with 'Back', 'Forward', 'Stop', 'Refresh', and 'Home' buttons, along with a search box. The address bar contains the text 'http://flame.cs.dal.ca/~kharrazi' and a 'Go' button. The main content area displays the following PHP array structure:

```
Array ( [Name] => Array ( [0] => Peter [1] => Mike [2]
=> Sarah ) [Age] => Array ( [0] => 23 [1] => 45 [2] =>
19 ) )
```

Below the array structure, the output is formatted as follows:

```
Person 1 = Peter Age = 23
Person 2 = Mike Age = 45
Person 3 = Sarah Age = 19
```

The browser's status bar at the bottom shows 'Done' and 'Internet'.

PHP Variables:Array (cont.)

array

```
<?php
```

```
$a = array ('Peter', 'Mike', 'Sarah');
```

```
$b = array (23, 45, 19);
```

```
$c = array ($a, $b);
```

```
// print_r will echo array's contents
```

```
print_r($c);
```

```
echo '<br><br>';
```

```
echo 'Person 1 = ' . $c[0][0] . ' Age = ' . $c[1][0] . '<br>';
```

```
echo 'Person 2 = ' . $c[0][1] . ' Age = ' . $c[1][1] . '<br>';
```

```
echo 'Person 3 = ' . $c[0][2] . ' Age = ' . $c[1][2] . '<br>';
```

```
?>
```

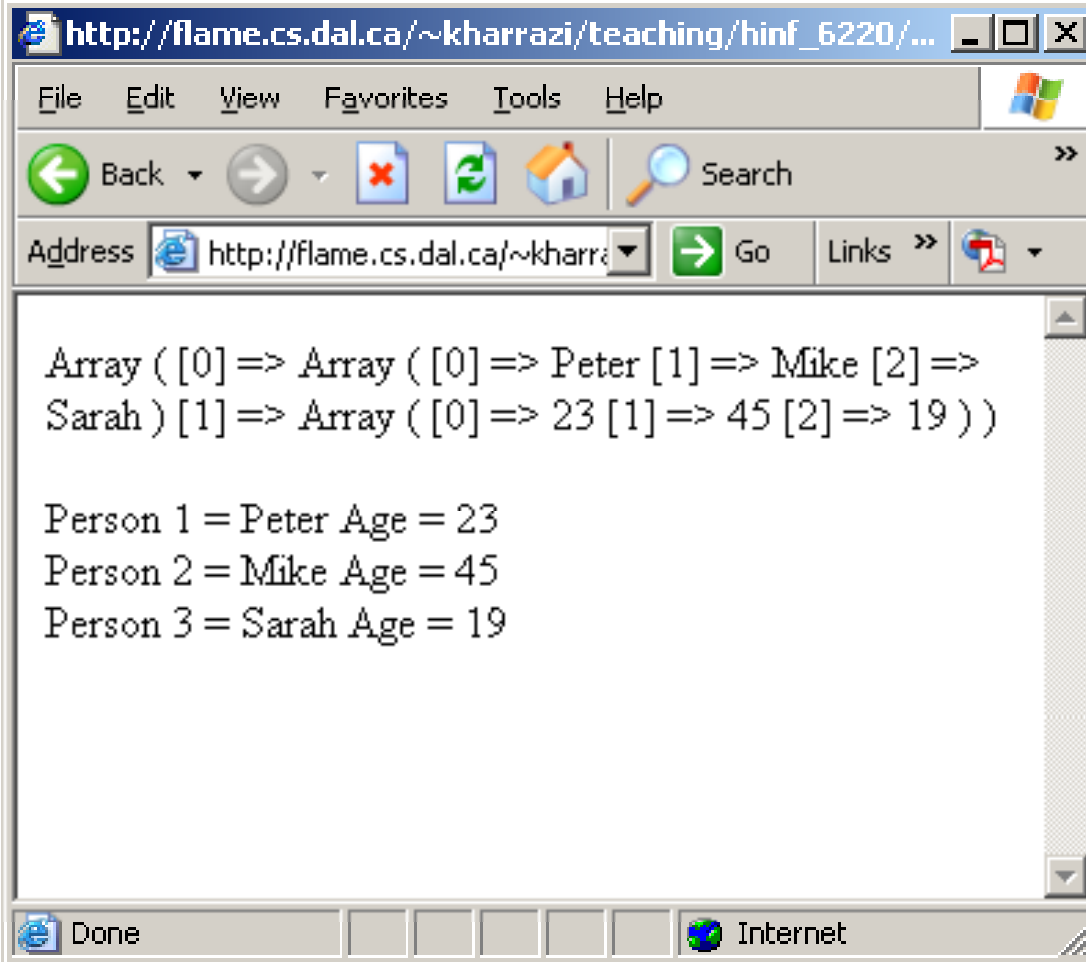

PHP Variables:Array (cont.)

array

\$c	\$a, \$b Element 1	\$a, \$b Element 2	\$a, \$b Element 3
\$c Element1 \$c [0] \$a	Peter \$c [0][0]	Mike \$c [0][1]	Sarah \$c [0][2]
\$c Element 2 \$c [1] \$b	23 \$c [1][0]	45 \$c [1][1]	19 \$c [1][2]

PHP Variables:Array (cont.)

array

The screenshot shows an Internet Explorer browser window with the address bar containing `http://flame.cs.dal.ca/~kharrazi/teaching/hinf_6220/...`. The browser's content area displays the output of a PHP script. The output consists of a multi-dimensional array representation and three lines of human-readable text. The array is: `Array ([0] => Array ([0] => Peter [1] => Mike [2] => Sarah) [1] => Array ([0] => 23 [1] => 45 [2] => 19))`. Below this, the text reads: `Person 1 = Peter Age = 23`, `Person 2 = Mike Age = 45`, and `Person 3 = Sarah Age = 19`. The browser's status bar at the bottom shows "Done" and "Internet".

```
Array ( [0] => Array ( [0] => Peter [1] => Mike [2] => Sarah ) [1] => Array ( [0] => 23 [1] => 45 [2] => 19 ) )

Person 1 = Peter Age = 23
Person 2 = Mike Age = 45
Person 3 = Sarah Age = 19
```

Summary

1. PHP Intro
2. PHP Syntax
3. PHP *echo*
4. PHP Commenting
5. PHP Variables

```
<?php ?>  
echo 'something'  
// or /* */  
$x = string, number, array
```
